...for use in disk player, converts path information defining playback of
 digital streams, jump commands of digital versatile disk video to playback
 control information of blu-ray disk

...Inventor: OKADA T

Alerting Abstract ...path information defining playback of digital stream, jump command of digital versatile disk (DVD) video to another playback path control information of digital stream for blu-ray disk (BD). A formatter allocates the playback path control information at specific track and generates a volume image for BD.DESCRPTION - An INDEPENDENT CLAIM is also included for computer-readable program executing volume image generation for blu-ray disk (BD)...

...USE - For generating volume image for disk player that plays read only memory blu-ray disk (BD-ROM) and digital versatile disk (DVD), in production studio to distribute movie contents...

Storage medium e.g. blu-ray disc, rental system, has blu-ray player reading corresponding piece of content data from disc and playing back designated piece of digital work based on read piece of data, when playback...

...Inventor: OKADA T

Alerting Abstract ...NOVELTY - The system has a blu-ray player (20) judging whether playback of a designated piece of digital work is permitted based on a read piece of content data when a storage medium e.g. blu-ray disc, and semiconductor memory are set. The player reads a corresponding piece of data from the disc and plays back the designated piece of work...

...USE - Used for renting a storage medium e.g. DVD or Blu-ray disc...

...ADVANTAGE - The blu-ray player effectively prevents unauthorized use of the rental information table, thus enabling a rental agent to easily protect digital work...

...20 Blu-ray player...

...50 Blu-ray disc

...Inventor: IKEDA W...

...OKADA T

Alerting Abstract ...NOVELTY - A controller (16) reads out audio-video
 (AV) stream recorded on blu-ray disk ROM (BD-ROM) and a hard
 disk (HD) (12). An audio decoder (6) and a video decoder (4) respectively
 acquires the audio data and...

...USE - For reproducing audio/video data recorded in optical disk
 (claimed) such as blu-ray disk ROM (BD-ROM).

32 playback control engine
33 module manager
34 HDMV module
35 BD-J platform
36 Java(TM))) virtual machine
37 application manager
38 function control unit

[Best Mode for Carrying Out the Invention]

EMBODIMENT...command-based execution environment. The other mode is an operating environment for Java(TM))) Virtual Machines. The former of the two operating environments is called HDMV mode, and the latter is called BD-J mode. Since these two operating environments exist, a dynamic scenario is described for either one of the operating environments. A dynamic scenario for HDMV mode is called a Movie Object. On the other hand, a dynamic scenario for BD-J mode is called a BD-J Object.

First, a...

...JPEG), PNG and other image data. Herewith, a Java(TM))) application can realize a different GUI framework from one realized by an IG stream in HDMV mode. The GUI framework in a Java(TM))) application includes HAVi framework specified in the GEM 1.0.2 and a remote control navigation mechanism...

...J Object is activated can be considered as a playback period of the Title. Similarly, since a Title is made up with one or more HDMV Objects, a period during which the HDMV Objects are activated can be considered as a playback period of the Title.

That is, FirstPlay Title, TopMenu Title, and other Titles are all made ...ROM or the local storage 20, and writes the uncompressed graphics to the Interactive Graphics plane 12.

To the Interactive Graphics (IG) plane 12, in HDMV mode, uncompressed graphics obtained by decode processing of the IG decoder 11 are written. In BD-J mode, characters and graphics drawn by an application...

...module manager 33 is present; and

c2) Layer on which the BD-J platform 35 is present. First, the Virtual File System 30 to the HDMV module 34 belonging to Layers 2 and 3 are described.

The virtual File System 30 is a virtual file system for integrally handling the download...

...and playback stop according to the current PL information and Clip information. These functions (i) and (ii) are executed according to

function calls from the HDMV module 34 and the BD-J module 35.

The module manager 33 holds Index.bdmv read from the BD-ROM and performs branch control. The...

...event to a dynamic scenario constituting the current title and by issuing an Activate event to a dynamic scenario constituting the branch-destination title.

The HDMV module 34 is the main execution body of the HDMV mode. The HDMV module 33 reads a MovieObject into the memory, decodes a navigation command described in the Movie Object, and executes a function call to the playback control engine 32 based on the result of the decoding.

Thus concludes the descriptions of the presentation engine 31 to the HDMV module 34. The BD-J platform 35 is described next.

The BD-J platform 35 is a so-called Java(TM)) platform, and has a...

OKADA, Tomoyukic/o Mat. Elec. Ind. Co., Ltd...

...SPECIFICATION for displaying subtitles represented by text codes, in synchronization with each picture of a motion picture. This is one of techniques unique to BD-ROM (Blu-ray Disc Read Only Memory) playback apparatuses.

When a BD-ROM playback apparatus displays a text subtitle, the BD-ROM playback apparatus performs a control to...

IKEDA, Wataruc/o Matsushita El. Ind. Co., Ltd...

...SPECIFICATION according to switching of playback paths as shown in FIG. 14;
 FIG. 16 shows state transition of disk contents;
 FIG. 17 shows Titles composed of HDMV-mode dynamic scenarios;
 FIG. 18 shows internal structures of Titles composed of BD-J-mode dynamic scenarios (BD-J Objects);
 FIG. 19 shows an internal...

...software stored in a ROM 21 and hardware, which are depicted in a layer model;
 FIG. 22 is a flowchart showing process procedures of an HDMV module 33 and a BD-J module for playing a title;
 FIG. 23A shows an internal structure of a PGC information table;
 FIG. 23B shows...

...a command-based execution environment. The other mode is an operating environment for Java Virtual Machines. The former of the two operating environments is called HDMV mode, and the latter is called BD-J mode. Since these two operating environments exist, a dynamic scenario is described for either one of the operating environments. A dynamic scenario for HDMV mode is called a Movie Object and defined by management information. On the other hand, a dynamic scenario for BD-J mode is called a...returning again to TopMenu Title is repeated endlessly until the BD-ROM is ejected.

A Title achieving such state transition is composed of dynamic scenarios in HDMV-mode or in BD-J mode. FIG. 17 shows two Titles composed of HDMV-mode dynamic scenarios. The first row in the figure shows a given Title(title(underscore)id) which is identified by an identifier of title(underscore)...

...navigation command instructing the playback device to perform playback of the PL (PlayPL command).

By making the PL belong to the Title, the Title in HDMV mode is able to define a movie work involving video playback. Thus concludes the structure of a Title defined by HDMV-mode dynamic scenarios.

Next is described the internal structure of a Title structured by a dynamic scenario in BD-J mode. FIG. 18 shows the...

...converts text codes included in a textST stream into bitmap format using character fonts, and writes the result in the Presentation Graphics plane 7.

In HDMV mode, the I-Graphics decoder 10 decodes an IG stream read from a BD-ROM or the Local Storage 18, and writes the uncompressed graphics...

...and playback stop according to the current PL information and Clip information. These functions (i) and (ii) are executed according to function calls from the HDMV module 33 and the BD-J module 35.

That is, when a function call instructing PL playback is made, the Playback Control Engine 32 reads...of the levels c1) and c2) below. That is,

c1) Level on which the Module Manager 34 is present; and
 c2) Level on which the HDMV module 33 and the BD-J module 35 are present. In the layer model of FIG. 33, the module manager 34 is located on the highest level.

The HDMV module 33 is the main execution body of the HDMV mode. When the module manager 34 makes an activate request

(activate(mobj(underscore)id)) that specifies a branch destination MovieObject by mobj(underscore)id, the HDMV module 33 reads MovieObject(mobj(underscore)id) into the local memory 26, decodes navigation commands described in the Movie Object, and executes a function call...

...Therefore, it is possible to prevent an application having no authorization from using the PLs.

FIG. 22 is a flowchart showing process procedures of the HDMV module 33 and BD-J module 35 for playing a title. A title playback procedure in a BD-ROM is described next with reference to...

...ROM, a scenario targeted for the process is called a current dynamic scenario. Command/Method i means, among navigation commands composing the current dynamic scenario (HDMV mode) and methods composing the dynamic scenario (BD-J mode), one to be a processing target. First, when notified of a title number for execution...

...SPECIFICATION based execution environment. The second mode is an operation environment of the Java Virtual Machine. Of these two operation environments, the first one is called HDMV mode, and the second one is called BD-J mode. Due to the presence of the two operation environments, the dynamic scenario is written by presuming either of the two operation environments A dynamic scenario presuming the HDMV mode is called Movie Object, and is defined by the management information. On the other hand, a dynamic scenario presuming the BD-J mode is...information and Clip information.

On the top layer is:

e) a module manager 34 that executes branching between Titles.

On a same layer between a HDMV module 33 and a module manager 34 are:

d-1) the HDMV module 33 that decodes and executes movie objects;

and

d-2) a BD-J module 35 that decodes and executes BD-J objects.

The BD...

...the current PL information and Clip information. The functions (i) and (ii) are performed in response to the function calls that are issued by the HDMV module 33, the module manager 34 and the BD-J module 35. That is to say, the playback control engine 32 executes its own functions ...

...the arrows with the signs ⊚2 and ⊚3 indicate the playback control engine 32 referencing the Clip information and the PlayList information.

The HDMV module 33 is a main body for execution in movie mode. If notified by the module manager 34 of a Movie Object that constitutes a branch destination, the HDMV module 33 reads, from the local memory 29, the Movie Object that constitutes the branch destination, decodes the navigation command written in the Movie Object...

...read from the BD-ROM, and performs a branch control . The branch control includes receiving a Title number that is a jump destination when the HDMV module 33 has executed a JumpTitle command or when the BD-J module 35 has issued a Title jump API, and notifying the Movie Object or the BD-J Object that composes the Title to the HDMV module 33 or the BD-J module 35. In FIG. 19, the arrows with signs (HamiltonOperator)0, (HamiltonOperator)1, and (HamiltonOperator)2 respectively indicate the...the branch destination label (step S33), extracts IDj from the Index of the Title number j in the Index Table (step S34), and causes the HDMV module 33 or the BD-J module 35 to execute the Movie Object or the BD-J object of the IDj (step S35).

At step...

...notification of an end of a Title from the application manager 36, and if there has been such notification (YES at step S32), causes the HDMV module 33 or the module manager 34 to execute the TopMenuOBJ that constitutes the top menu Title (step S36).

The following describes an example of...35 is this Java platform, a playback apparatus according to the present invention sharetelephone.

(K) In the layer model, the HDMV mode may be positioned on the BD-J mode. This is because especially the analysis of the dynamic scenario in the HDMV mode and the execution of the control procedure based on the dynamic scenario put light load on the playback apparatus, and there is no problem in executing the HDMV mode on the BD-J mode. Also, in the development process of the playback apparatus or a movie work, the operations can be guaranteed by...

...in Embodiment 5, a playback control can be performed in synchronization with a playback of a PL in the BD-J mode, and therefore the HDMV mode may not necessarily be provided.

(L) A navigation command may be provided for a interactive graphics stream that is to be multiplexed on an...

Detailed Description

Detailed Description

... MPEG-2 and MPEG-4 standards. The VC-1 is
expected to be used for next-generation optical disk peripheral
to devices, such as a Blu-ray disc (BD) and a High
Definition (HD) DVD.

In general, in coding of a moving picture, compression of
information volume is performed by eliminating redundancy...picture
decoding apparatus 100 according to the second
variation can reduce the load of the decoding still pictures used in an
application such as a Blu-ray Disc (BD),

For a stream, there are two kinds of methods for generating a
sequence in which pictures are still. By one method, one or...media and
the like, such as a method using a transport
stream packet of the MPEG-2 system or a packet which is defined in
Blu-ray Disc (BD),

Moreover, in the simple profile and the main profile,
Skipped-picture cannot be identified by the picture type in the
picture layer.

Therefore...

download and playback according to a third of the invention.

5 Brief Description of the Appendix

[0005] The attached Appendix, entitled "White Paper - Blu-ray
Disc

Read Only Disc Format Part 3 Audio Visual Application Specifications" has
been included to provide a deeper understanding of at least some of the

...media similar to a conventional DVD. However, in the context of the present invention, disc storage 120 is designed to respond to a 405 nm ("Blu-Ray") laser that provides higher density storage than conventional DVDs. Thus, disc storage 120 may support higher definition video, as opposed to standard definition video provided...

Detailed Description

Detailed Description

... which subtitles are displayed by writing to the Graphics Plane four times, and an update is performed for displaying each of two subtitles "what is blu-ray." and "blu-ray is everywhere." FIG.24 illustrates chronological transition of the update in the example. Until a point t1, "what" is displayed, and "what is" is displayed after the t1, till a t2, and then "what is blu-ray." is displayed at a t3. After a whole sentence of a first subtitle has appeared, a second subtitle "blu-ray is everywhere." is displayed at a t4.

FIG. 25A illustrates four Display Sets that are described so as to perform the above explained update...

...includes

a PCS1.2 for controlling an update at the t1, a PDS1 for coloring, an ODS1 corresponding to the subtitle "what is blu-ray.", and an END as an ending code of the DS1.

A DS2 includes a PCS1.2 for controlling an update at

the t2, and an...

...END. A DS 4 includes a PCS2 for controlling an update at the t2, a PDS2 for color conversion, an ODS2 corresponding to the subtitle "blu-ray is everywhere.

and an END.

Referring to a timing chart in FIG. 25B, settings of DTS and PTS for each functional segment in the four...

...at a display point t1 for displaying "what /ff
a display point t2 for displaying "what is", a display point
t3 for displaying "what is blu-ray.", and a display point
t4 for displaying "blue-ray is everywhere.". Each PTS are
set as above, because it is necessary that-the control such...

...described
in a programming language. Producers that perform authoring
may obtain the data structures, on the BD-ROM by describing
the class structure according to the syntax provided in the
Blu-ray Disc Prerecording Format.

Next, a practical example of a reproduction apparatus
according to the present invention is explained below. FIG. 26
illustrates an internal structure of the reproduction
apparatus according to the...

Abstract: Although many images are handled in the medical filed, image monitoring devices and filing methods vary due to differences in resolution and pixel depth. If a system enabling such images to be filed synthetically without losing its quality were to exist, and if retrieval of such images were made easily, such a system could be applied in various ways. In order to determine whether a super high definition (SHD) image system running at a series of 2048 resolution*2048 line*60 frame/sec was capable of such purposes, we established a filing system for medical images on this system. All images of various types produced form one case of cardiovascular disease were digitized and registered into this filing system. All images were animated and totaled a number of 243. We prepared a graphic user interface for image retrieval based on the medical events and modalities. Twenty one cardiac specialists evaluated quality of the SHD images to be somewhat poor compared to the original pictures but sufficient for making diagnoses, and effective as a tool for teaching and case study group purposes because of its operability of the retrieval system. The system capability of simultaneously displaying several animated images was especially deemed effective in grasping comprehension of diagnosis. (2 Refs)

Subfile: C

Descriptors: computer animation; graphical user interfaces; information retrieval; medical image processing; patient diagnosis; visual databases

Identifiers: medical image filing system; superhigh-definition image; graphic user interface; image retrieval; animated images; diagnosis

Class Codes: C7330 (Biology and medical computing); C6160S (Spatial and pictorial databases); C7250R (Information retrieval techniques); C6180G (Graphical user interfaces); C6130B (Graphics techniques); C5260B (Computer vision and image processing techniques)

Title: Hi-Vision production equipments

Author(s): **Okada, T.**; Morita, S.; Iida, H.
 Author Affiliation: Div. of Radio Telecommun., Matsushita Commun. Ind. Ltd., Osaka, Japan
 Journal: National Technical Report vol.37, no.5 p.60-9
 Publication Date: Oct. 1991 Country of Publication: Japan
 CODEN: NTROAV ISSN: 0028-0291
 Language: Japanese Document Type: Journal Paper (JP)
 Treatment: Applications (A); Practical (P)
 Abstract: Switchers which are the core of the production system and an electronic character and graphic generator have been developed as applications of the current NTSC system. The analog switcher has the same functions and operability. The digital switcher satisfies the BTA S-001 Standard, featuring stability and functions as high as those of the digital switcher of the NTSC system. A Hi-Vision movie van is introduced as an example of the system application of these switchers. (2 Refs)
 Subfile: B
 Descriptors: high definition television; road vehicles; television equipment
 Identifiers: HDTV; Hi-Vision production; electronic character and graphic generator; NTSC; operability; digital switcher; van
 Class Codes: B6430C (High definition television)

Detailed Description

Publication Year: 1993

Detailed Description

... approximately half way between two events defining different states.

The exact

point at which a parameter state changes can be operator controlled by
providing an event defining a first parameter state at
the last frame desired forthe first state and then providing an event at the next
frame time whichdefines a desired different state for the parameter. As an example, a
control ...special effect system 12 later operates during the running of
the effect to provide interpolation of the specified parameter from its
status at a preceding event to its status at the new event.The first field time is inherently an event at which
all parameters are set equal to nominal default values. The parameters
remain at those values unless some subsequent event changes the
parameter. In...

RECORD TYPE: FULLTEXT; ABSTRACT

WORD COUNT: 889 LINE COUNT: 00069

...ABSTRACT: only file is 4Kbytes on a 240Mbyte drive, and 8Kbytes on a
500Mbyte volume. One way of foiling this is to use multiple partitions, but
HD SC Setup will not recognize non-Macintosh segments. Using the
Custom button in graphical partition mode will enable sectors
to be labeled as scratch segments, but they will not be recognized on the
desktop. Restoring these to Macintosh format...

... an important function completely lacking in HD SC Setup.

Doing the two-step

Programmer Fabrizio Oddone devised a novel solution to the
partitioning problem of HD SC Setup. The process combines HD SC
Setup with his own utility, and it works like this:

You open HD SC Setup and select the Partition button and
then the Custom button to get to its graphical partitioning
mode.

Next, you define multiple partitions of any size. Only one can be a
Macintosh partition, so the others are defined as "scratch" partitions...

Abstract: Magnetic head-disk interfaces (**HDI**) which are designed so that the mechanical spacing, between the magnetic recording head and spinning disk media, is so small that frequent intermittent contacts occur during normal steady state operation, can be said to be operating in the "proximity" recording regime. Mechanical spacing ("fly height") modulation, with characteristic frequency well above the estimated air bearing resonance frequencies, but well below slider ringing frequencies, has been observed in the proximity recording regime. In this paper, the effect of slider preload change, and the effect of atmospheric pressure change, on the frequency and amplitude of such fly height modulation, as measured using laser Doppler vibrometry, is reported. A simple analytical model was developed to explain the existence of the modulation and its observed dependence on applied gram load. (6 Refs)

... by rival consumer electronics giants: The Toshiba Alliance's Super Density Disc (SD), and Sony-Philips' Multi Media Compact Disc (MMCD). Proposed applications ran from high-definition audio to increased data storage for CD-ROM to a whole new consumer video format. Of all the possible applications, quality video on a single...redundancy is another area in which preparation prior to encoding can improve the resulting MPEG-2 video. Redundancy of video information is built into every video stream that originates on film. During telecine, individual frames of film are duplicated at regular intervals during the 3:2 process. This 3:2 is needed to convert 24 frames-per-second film into 30 (29.97) frames-per-second (59.97 field-per-second) NTSC video. For example, two fields derived from film frame A are followed by three fields from film frame B, etc. Two video...

Video Imperatives: High Capacity And Uninterrupted Throughput

Adequate disk drive capacity is the cost of entry for desktop video. An hour of video, depending on the compression method, typically...

...the application. This is because video is time-sensitive. Home TV broadcast quality video is based on NTSC determined standards-30 frames of video per second with two fields of interlaced video per frame. This information must be continuously delivered to the frame buffer in the display device, otherwise the video stream breaks up and the audio degrades. Audio is often the critical application, as the human ear is sensitive to out-ofsync video and phase errors...

Alerting Abstract WO A1

NOVELTY - The pixel value components are generated using original pixel values of video image. A filler pixel value is generated based on weight of pixel value components. The filler pixel and original video image are combined to generate a video image.

DESCRIPTION - A motion value equal to difference between values of original pixels of video images, is generated. When the motion value becomes a non-zero number, it indicates motion of filler video image. An INDEPENDENT CLAIM is also included for image processing method.

USE - For estimating filler pixel values from original pixel values in video stream of high definition television (HDTV).

ADVANTAGE - Detects significant inter-field motion, thereby assigns correct weighting to spatial and temporal approaches. Distinguishes thin line from edges more accurately, thus produces fewer visual artifacts.

Title Terms/Index Terms/Additional Words: IMAGE; PROCESSOR; CIRCUIT; VIDEO;

Alerting Abstract WO A1

NOVELTY - Two video fields of the video sequence are compared to determine if one of the fields is a repeat field. A telecine mode is declared if sequence of repeat fields corresponds to a telecine pattern.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.Telecine mode detecting apparatus;

2.Encoding system

USE - For high definition television video encoding system.

ADVANTAGE - Redundant fields can be identified and dropped from the video bit stream. Ensures seamless transition by instructing multiple encoders simultaneously to drop fields. Provides accuracy in detecting matched fields in a sequence and provides cost savings by using single logic device.

DESCRIPTION OF DRAWINGS - The figure shows schematic block diagram of High definition television video encoding system.

Title Terms/Index Terms/Additional Words: TELECINE; MODE; DETECT; METHOD;

Detailed Description

managing reproduction of graphic data, comprising:
a data area storing one or more graphic segments, each of which includes graphic data, multiplied with other data, and each graphic segment including a plurality of transport packets.

2 The recording medium of claim 1, wherein the other data includes movie data.

3 The recording medium...

...at least one of movie data, audio data and still picture data.

4 The recording medium of claim 1, wherein each transport packet in a graphic segment has a same packet 15 identifier (PID).

5 The recording medium of claim 1, wherein at least one transport packet in a graphic segment includes an identifier that the transport packet is part of a graphics packet.

6 The recording medium of claim 1, wherein at least one 20 transport packet in the a graphic segment includes a time stamp.

7 The recording medium of claim 1, wherein at least one transport packet in a graphic segment includes graphic information for managing reproduction of graphic images.

8 A method of reproducing a data structure for managing reproduction of graphic data from a recording medium, comprising:
reproducing one or more graphic segments from the recording medium, each of which includes graphic data, 30 multiplied with other data, and each graphic segment including a plurality of transport packets.

1 6

. An apparatus for reproducing a data structure for managing reproduction of graphic data from a recording medium, comprising:

a driver for driving an optical reproducing device to 5 reproduce data recorded on the recording medium;
a controller for controlling the driver to reproduce one or more graphic segments from the recording medium, each of which includes graphic data, multiplied with other data, and each graphic segment including a plurality of transport 10 packets.

10 A method of recording a data structure for managing reproduction of graphic data on a recording medium, comprising:
recording one or more graphic segments on the recording 15 medium, each of which includes graphic data, multiplied with other data, and each graphic segment including a plurality of transport packets.

11 An apparatus for recording a data structure for managing reproduction of graphic data on a recording medium, comprising:
a driver for driving an optical recording device to

11

indexing each of the graphic images, display timing information for specifying display start time and display duration for each of the graphic images, display-info field for specifying display position and window size of each of the graphic images on a main image, and display-effect field for providing various graphic effects such fade/wipe-in/wipe-out, as described above with reference to FIG. 18.

In an embodiment of a method of recording and managing navigation information for reproduction of graphic images as 10 buttons on the screen, the navigation information is stored as Button-Info contained in menu information, as shown in FIG. 20. The menu information may be stored in a playlist file or stored as an individual file.

Button information is provided for each button. The button

15 information is navigation information for reproduction of graphic images to be displayed as a button. Each button information field includes a length field indicating the length of the button information field,

ref-to

graphic

image

index field for indexing each of the

20 graphic images, display timing information for specifying display start time and display duration for each of the graphic images, display-info field for specifying display position and window size of each of the graphic images on a main image, and display effect field for providing various 25 graphic effects such fade/wipe-in/wipe-out, as described above with reference to FIG. 18.

Fig. 21 illustrates a schematic diagram of an embodiment of...

...3 to reproduce this data structure. Based on the information contained therein, as well as user input received over the user interface (e.g., control buttons on the recording and reproducing apparatus or a remote associated with the apparatus), the controller 10 controls the drive 3 to 30 reproduce the data...

...portions of Fig. 21 providing the recording or reproducing function.

The recording medium having a data structure for, and the methods and apparatuses of, managing graphic data for a high density recording medium in accordance with the invention 25 allows one or more graphic images to be overlaid on a movie video or still image simultaneously or individually in succession, allows graphic images to be presented along with audio, and allows displaying of various graphic images such as buttons for selecting associated functions.

while the invention has been disclosed with respect to a limited number of embodiments, those skilled in the art, having the...

Claim

1 A recording medium having a data structure for

audio-only clip A/V stream. The syntax of the sub-playitem for graphic images is extended from the syntax of the general subplayitem defined for managing dubbed audio in the BD-RE.

As shown in FIG. 18, the syntax of the sub-playitem for graphic images conforms to the syntax of the general subplayitem but some fields are extended to include graphic control information. Accordingly, only the differences from the general definition will be described. The length field of the sub-playitem is given a unique...

...0 of BD-RE standard.

10

The sub-playitem includes a Clip codec-identifier field for indicating that the sub-playitem is associated with a graphic image and a SubplayItem-type field for specifying a path for displaying the associated graphic image. For example, the Clip codec-identifier field may have a value of 'GRAF' and the SubplayItem-type may have a value of 4.

The sub-playitem includes SubPlayItem-IN-time field for indicating the display time of a beginning graphic image and SubPlayItem-OUT-time for indicating display duration or ending time of all of the graphic images. The sub-playitem further includes ref-to

graphic image-index field for indexing each of the graphic images, display timing information for specifying display start time and display duration for each of the graphic images, display-info field for specifying display position and window size of each of the graphic images on a main image, and display effect field for providing various graphic effects such fade/wipe-in/wipe-out for each of the graphic images.

In-another embodiment of a method of recording and managing navigation information for reproduction of graphic images along with still images, the navigation information is stored as still image information, which includes a

graphic display@info field, as shown in FIG. 19. The still image information may be stored in a playlist file or stored as an individual file. For example, the playlist graphic indicator of FIG. 16 may be newly defined as a graphic display information field in the still image information field.

The graphic display information field includes a length indicator indicating a length of the graphic display information field and a number-of

graphic images field indicating the number of graphic images to be displayed. For each graphic image, the graphic display information field includes the fields of: a ref-to graphic image-index field for

number
of

graphic

images field indicative of the number of graphic images to be displayed.

For each graphic image, the graphic mark further includes a ref-to

graphic

image-index field for indexing each of the graphic images, display timing information for specifying display start time and display duration for each of the graphic images, display-info field for specifying display position and window size of each of the graphic images on a main image, and display effect field for providing various graphic effects such fade/wipe-in/wipe-out for each of the graphic images.

when the navigation information is stored as playlist graphic indicators, the syntax of the playlist graphic indicator, which is not defined in the BD-RE, is newly defined and a unique version number that is not used in the BD-RE is

9

assigned to the playlist graphic indicators, as shown in FIG.

16.

The playlist graphic indicator information field includes a length indicator indicating a length of the playlist still

5 indicator information field and a

number

Graphic

Display

positions field indicating the

number of graphic display positions. For each graphic display position, the playlist graphic indicator field further includes a graphic

display

start-time-stamp field, and

10 duration information.

The playlist graphic indicator further includes

number

of

graphic

images field indicative of the number of

graphic images to be displayed. For each image, the following additional fields are provided: a ref-to

graphic

image-index

15 field for indexing each of the graphic images, display timing information for specifying display start time and display duration for each of the graphic images, display info field

for specifying display position and window size of each of the graphic images on a main image, and display effect field for

20 providing various graphic effects such fade/wipe-in/wipe-out.

In another embodiment shown in FIG. 17, navigation information for one or multiple graphic images is stored as sub-playitems in a playlist for playback control of a movie or

FIG. 9.

When reproducing a main stream (e.g., movie video, audio, or still images) recorded after the prescribed segment, the 5 optical disk reproducing apparatus sequentially reproduces the graphic images in the graphic image buffer along with the main stream using the graphic information as described above with reference to FIG. 7 and FIG. 8.

When the graphic images are reproduced along with a movie 10 as shown in FIG. 10, the graphic images are overlaid on the movie video, wherein the graphic images may be overlaid on the movie video simultaneously or individually in succession and the positions of the graphic images on the movie video may be different from each other.

When the graphic images are reproduced along with an audio-only clip as shown in FIG. 11, one or multiple graphic images are displayed at a particular position(s) of the screen, wherein the graphic images may be presented simultaneously or individually in succession as in animations and the positions 20 of the graphic images may be different from each other. When the graphic images are reproduced along with still images as shown in FIG. 12, the graphic images are overlaid on the still images, wherein the graphic images may be overlaid on one still image simultaneously or individually in 25 succession and the positions of the graphic images on the still images may be different from each other.

The graphic images may be presented along with audio and still images as shown in FIG. 13, wherein the graphic images are overlaid on the still images at a particular position(s).

30 The graphic images may be overlaid on one still image simultaneously or individually in succession and the positions of the graphic images on the still images may be different from each other.

8

In an embodiment of a method of recording and managing navigation information for reproduction of the graphic images as shown in FIG. 14, navigation information for one or multiple graphic images is stored in a playlist for playback 5 control of a movie or audio-only clip A/V stream as graphic marks or playlist graphic indicators.

When the navigation information is stored as graphic marks, the mark syntax of, for example, the BD-RE standard may be used for the graphic mark by extending the meaning of each field thereof, as shown in FIG. 15. Accordingly only the difference from the BD-RE standard will be described. The mark type field of the graphic mark is given a unique value that is not defined in the BD-RE standard, for example, 'mark
type=0x131.

The graphic mark includes ref-to-graphic
start-index
field for indexing a beginning graphic image or graphic image group, duration information for specifying display duration required for all of the graphic images, and

the TP extra header includes copy protection information and a packet arrival time...

...header of an MPEG2 TP includes a packet identifier (PID). The PID is given a unique value, for example, 'PID=0x10231 when the packet is a graphics packet.

Because graphic images are recorded as MPEG2 TPs in the recording segment, the recording format of the graphic images is compatible with that of movie data, for example, movie data of the BD-RE format. When graphic images and a main stream are multiplexed in the prescribed recording segment, the main stream corresponds to one among MPEG2 movie data, audio data, or still images.

As shown in FIG. 6, the beginning part of the prescribed recording segment includes a source packet of graphic information for managing reproduction of the graphic images recorded therein. An optical disk reproducing apparatus

6 performs reproduction of the graphic images by checking the number of graphic images, data size, etc using the graphic information.

The graphic images recorded in the prescribed recording 5 segment can be identified by the source packet of the graphic information. As shown in FIG. 7, the graphic information contained in the payload of the source packet may include fields of graphic start end flag, number of images, image info indicating attributes and properties of each graphic image 10 (e.g., position to display a graphic image, presentation time to display a graphic image, duration to display a graphic image, etc.), and image-data-size indicating the size of each graphic image or start position information.

If the graphic start-end-flag field is 101, it indicates 15 the beginning of the graphic data; otherwise it indicates the ending of the graphic data. Some of the fields of the graphic information can be used as information about one graphic image or all of the graphic images.

In an example shown in FIG. 8, the graphic images 20 recorded in the prescribed recording segment can be identified by the TP extra header, wherein the TP extra header of the first source packet of each graphic image includes 2-bit copy protection information and 30-bit graphic information. The graphic information can be defined in the same manner as the 25 graphic information shown in FIG. 7.

The TP extra header of the other source packets includes 2-bit copy protection information and other 30-bit information such as a packet arrival time stamp.

If a high density recording medium such as a BD-ROM disk 30 having graphic images and graphic information recorded in the aforementioned manner is inserted into an optical disk reproducing apparatus, the apparatus conducts a preloading operation that loads all the graphic data recorded in a

7

prescribed segment into a graphic image buffer, as shown in

...order that the invention may be fully understood, exemplary embodiments thereof will now be described with reference to the accompanying drawings.

FIG. 3 is a graphical representation of an embodiment of a method of managing graphic data for a high-density optical disk in accordance with the present invention. A main picture image has one or more corresponding graphic images, which have different sizes and color depths.

As shown, the main picture of size 1920x1080 pixels has three different associated graphic images, a graphic image of size 1920x1080 pixels, a graphic image of size 1280x1080 pixels, and a graphic image of size 640x1080 pixels.

The three graphic images have different color depths. The 15 1920x1080 graphic image has an 8-bit color depth, the 1280x1080 graphic image has an 8-bit or 16-bit color depth, and the 640x1080 graphic image has an 8-bit, 16-bit, or 24-bit color depth.

As shown in FIG. 4, a plurality of different graphic 20 images, graphic images 1, 2, and 3, may be simultaneously overlaid on one main picture image and the plurality of graphic images may have different sizes and color depths. The plurality of graphic images may be managed individually or as a group.

The overlaid graphic images and navigation information therefor are multiplexed with main video and audio streams, which will be described in detail below.

FIGS. 5-8 illustrate examples showing how graphic images and navigation information are recorded in a main stream on a 30 high density recording medium such as a BD-ROM. As shown in

FIG. 5, multiple graphic images are recorded in a prescribed recording segment (e.g., A, B, or C) of an audio/video main stream recorded in a data area of a BD-ROM. The multiple 5 graphic images are multiplexed in the prescribed segment.

Graphic images recorded in the prescribed segment, (e.g., A) are graphic images to be overlaid with the main stream recorded after the segment. A graphic image is recorded as a 5 plurality of 192-byte source packets, each comprising a 4-byte TP (Transport Packet) extra header and a 188-byte MPEG2 TP. In the recording segment, only graphic images are recorded or graphic images are multiplexed with the main stream.

The 4-byte TP extra header may include 2-bit copy 10 protection information and 30-bit navigation information for an associated graphic image (e.g., Image-start-end-flag described in detail below) or a 30-bit packet arrival time stamp.

In detail, if a source packet is associated with a graphic image, the TP extra header thereof includes copy protection information and graphic information (e.g., Image-start-end-flag described in detail below). Otherwise,

10 3. DISCLOSURE OF INVENTION

The recording medium according to the present invention includes a data structure for managing reproduction of graphic data.

In one exemplary embodiment, a data area of the recording medium includes one or more graphic segments, each of which includes graphic data, multiplied with other data. For example, the other data includes movie data. Each graphic segment includes a plurality of transport packets.

In one exemplary embodiment, each transport packet in a graphic segment has a same packet identifier (PID).

In another exemplary embodiment, at least one transport packet in a graphic segment includes an identifier that the transport packet is part of a graphics packet.

In a further exemplary embodiment, at least one transport packet in the a graphic segment includes a time stamp.

In a still further exemplary embodiment, at least one transport packet in a graphic segment includes graphic information for managing reproduction of graphic images.

The present invention further provides apparatuses and methods for recording and reproducing the data structure according to the present invention.

3

, BRIEF DESCRIPTION...

...of the invention, and together with the description, serve to explain the principles of the present invention.

In the drawings.

FIG. 1 illustrates a graphical representation of main video overlaid with graphic images according to the DVD-Video standard;

FIG. 2 illustrates a structure of graphic data in the DVD-Video standard;

FIG. 3 illustrates a graphical representation of a plurality of graphic images of different sizes and color depths to be overlaid on a main picture according to the present invention;

FIG. 4 illustrates a graphical representation of a main data overlaid with a plurality of graphic images of different sizes and color depths;

FIGS. 5-8 illustrate examples showing how graphic images and navigation information are recorded in a main stream on a high density recording medium according to the present invention;

FIG. 9 illustrates a preloading operation for loading graphic data recorded in a segment into a graphic image buffer;

FIGS. 10-13 illustrate exemplary embodiments of graphic information in accordance with the invention;

FIGS. 14-20 illustrate exemplary embodiments of navigation information in accordance with the invention; and Fig. 21 illustrates...

graphic data for a high-density recording medium such as an optical disk (e.g., a Blu-ray Disc ROM (BD-ROM)).

2, BACKGROUND ART

Recording media such as optical disks capable of recording large amounts of high-quality digital video/audio data, for example, DVDs (digital...

...the market. The types of DVDs include DVD-Video, DVD-VR (Video Recording), DVD-Audio, and 15 DVD-AR (Audio Recording).

In the DVD-Video, graphic data to be reproduced in synchronization with a video/audio data stream is defined by the DVD-private format and designated as sub-pictures.

A sub-picture of the graphic data is of size 720x480 20 pixels and has a palette with 2-bit color depth, which can support up to 16 colors. The graphic data is recorded on the DVD after being multiplexed with the video/audio stream.

A run-length coding method according to the DVD-Video standard is applied to the graphic data in which display 25 control information about sub-picture data is included. The display control information includes information on display timing, color change, blending ratio change, display position, size selection, etc.

Operations for providing various graphic effects to the

1

graphic data, such as scroll-up/down, fade/wipe-in/out, and color change, can be performed selectively on a time basis.

Navigation information for the...

...information and language information.

An optical disk reproducing apparatus such as a DVD player displays the main video image and some or all of the graphic image of a sub-picture unit (SPU) as shown in Fig. 1 by blending the images using navigation information, wherein the graphic image of the sub-picture unit (SPU) is overlaid 15 on the main video image on a presentation time basis.

As shown in FIG. 2...

...being synchronized with the audio and video data. As alluded to above, the apparatus displays the main video image and some or all of the graphic image of a sub-picture unit

2

(SPU) by blending the images using the navigation information, wherein the graphic image of the sub-picture unit (SPU) is overlaid on the main video image in various ways on a presentation time basis.

The standardization for high-density read-only optical disks such as the Blu-ray disc ROM (BD-ROM) is still under way. A method for effective managing graphic data recorded on the high-density read-only optical disk such as a BD-ROM is not yet available.

RECORDING MEDIUM HAVING A DATA STRUCTURE FOR MANAGING REPRODUCTION OF
GRAPHIC DATA AND RECORDING AND REPRODUCING METHODS AND
APPARATUSES

Fulltext Availability:

Detailed Description
Claims

English Abstract

The recording medium includes a data area storing one or more
graphic segments, each of which includes graphic data,
multiplied with other data.

Detailed Description

D E S C R I P T I O N

RECORDING MEDIUM HAVING A DATA STRUCTURE FOR
MANAGING REPRODUCTION OF GRAPHIC DATA AND
RECORDING AND REPRODUCING METHODS AND APPARATUSES

5 1. TECHNICAL FIELD

The present invention relates to a method of managing

medium is a BD-ROM.

8 The recording medium of claim 1, wherein two or more
30 graphic image information segments share a same palette
information segment.

16

. A method of reproducing a data structure for managing
reproduction of graphic data from a recording medium,
comprising:
reproducing at least one graphic image information
5segment and at least one palette information segment from the
recording medium, each palette information segment providing
color information, each graphic image information segment
providing reproduction information for reproducing one or more
graphic images.

10 An apparatus for reproducing a data structure for
managing reproduction of graphic data from a recording medium,
comprising:
a driver for driving an optical reproducing device to
reproduce data recorded on the recording medium;
a controller for controlling the driver to reproduce at
least one graphic image information segment and at least one
palette information segment from the recording medium, each
palette information segment providing color information, each
graphic image information segment providing reproduction
20 information for reproducing one or more graphic images.

11 A method of recording a data structure for managing
reproduction of graphic data on a recording medium,
comprising:
recording at least one graphic image information segment
25 and at least one palette information segment on the recording
medium, each palette information segment providing color
information, each graphic image information segment providing
reproduction information for reproducing one or more graphic
images.

12 An apparatus for recording a data structure for
managing reproduction of graphic data on a recording medium,
comprising:
a driver for driving an optical recording device to
17
record data on the recording medium;
an encoder for encoding at least multiple reproduction
path video data; and
a controller for controlling the driver to record at
least one graphic image information segment and at least one
palette information segment on the recording medium, each
palette information segment providing color information, each
graphic image information segment providing reproduction
information for reproducing one or more graphic images.
18

because graphic images and still images have the same format.

The image encoder may be a JPEG encoder, MPEG2 I-picture, 25 encoder, etc.

In the first...

...the invention

described above with reference to FIGS. 12 and 14, the quantization is performed according to a flow diagram illustrated in FIG. 17.

A graphic image is generated (S20) and a quantization step size is set (S21). The graphic image is encoded (S22) with the given step size, and the size of the encoded image is examined. If the size does not exceed a...

...3 to reproduce this data structure. Based on the information contained therein, as well as user input received over the user interface (e.g., control buttons on the recording and reproducing apparatus or a remote associated with the apparatus), the controller 10 controls the drive 3 to reproduce the data from...

...18 providing the recording or reproducing function.

The data structure of the high density recording medium for, and the methods and the apparatuses of, managing graphic 14

data for a high-density optical disk in accordance with the invention allow high-resolution graphic images to be overlaid on main video reproduced from the high-density optical disk with various sizes and color depths.

While the invention has been...

Claim

1 A recording medium having a data structure for managing reproduction of graphic data, comprising:
a graphic information area including at least one graphic 5 image information segment and at least one palette information segment, each palette information segment providing color information, each graphic image information segment providing reproduction information for reproducing one or more graphic images.

2 The recording medium of claim 1, wherein the reproduction information identifies a palette information segment to use in reproducing one or more graphic images.

3 The recording medium of claim 2, wherein two or more graphic image information segments include reproduction 15 information that identify a same palette information segment.

4 The recording medium of claim 1, wherein each palette information...

...blending ratio indicating a level of transparency for the associated color information.

7 The recording medium of claim 1, wherein the recording

In this embodiment, high-resolution graphic data is recorded on a BD-ROM 30 in accordance with the JPEG format by a lossless encoder comprising a predictor 31 and an entropy encoder 32, and JPEG graphic images are reproduced from the 30 BD-ROM 30 by a lossless decoder comprising an entropy decoder 33 and a predictor 34.

The predictor 31 calculates a prediction value of each pixel and...

...not included.

In a third embodiment of the invention shown in FIG. 14, 10 a discrete cosine transform (DCT) method is used, wherein high-resolution graphic data is encoded in accordance with MPEG2 I-picture format.

As described above with reference to FIG. 12, high resolution graphic data is recorded on a BD-ROM 40 in 15 accordance with the MPEG2 I-picture format by a DCT-based encoder comprising a forward discrete cosine transform (FDCT) unit 41, a quantizer 42, and an entropy encoder 43 and MPEG2 I-picture formatted graphic images are reproduced from the BD-ROM 40 by a DCT-based decoder comprising an entropy 20 decoder 44, a dequantizer 45, and an inverse DCT unit 46.

The MPEG2 I-picture...

...methods are also 25 different.

In a fourth embodiment of the invention shown in FIG. 15, a statistical coding method is used, wherein high-resolution graphic data is encoded by entropy coding.

In this embodiment, high-resolution graphic data is 30 recorded on a BD-ROM 50 by an entropy encoding unit comprising a run-length encoder 51 and a variable length coding (VLC) encoder 52. Graphic images are reproduced from the BD-ROM 50 by an entropy decoding unit comprising an 11 entropy decoder 53 and a VLC decoder 54.

In the case where successive pixels having the...

...encoding method used in the MPEG or JPEG format may be employed.

In a fifth embodiment of the invention shown in FIG. 16f high-resolution graphic data is encoded in accordance with a 15 format identical to the still image coding format.

In this embodiment, high-resolution graphic data is recorded on a BD-ROM 60 and graphic images are reproduced from the BD-ROM 60 in accordance with the still image coding format.

In this case, the structure for stream decoding is relatively simple and a single image encoder and decoder are shared by still image processing and graphic image processing

for individual graphic images. The palette information,
8
however, may be shared by the groups of graphic images,
thereby effectively reducing the size of palette information
recorded on a high-density recording medium such as a BD-ROM.

In another embodiment of a method of managing graphic
5 data for a high-density optical disk according to the
invention, the main picture image is overlaid with graphic
images by a-blending. If an individual blending ratio is
assigned to each pixel value as done in the DVD-Video
standard, the resultant data...

...non
uniform intervals. An individual blending ratio may be
20 assigned to each color palette (e.g., indicated as part of
the palette information), each graphic image, each title of
main video, or each playlist.

When each color palette is given a blending ratio, the
blending ratio may be shared by a plurality of graphic images
25 through the navigation information as described above with
reference to FIG. 9.

The DVD-Video standard employs a general run-length
coding method to reduce the data size of 2-bit color depth
graphic images using a run-length encoder 11 and a run-length
30 decoder 12, as shown in FIG. 11. In this case, the coding
efficiency...

...is required. In a first embodiment of
9
the invention shown in FIG. 12, a discrete cosine transform
(DCT) method is used, wherein high-resolution graphic data is
encoded with compression into JPEG images.

In this embodiment, high-resolution graphic data is
5 recorded on a BD-ROM 20 in accordance with the JPEG format
by
a DCT-based encoder comprising a forward discrete cosine
transform (FDCT) unit 21, a quantizer 22, and an entropy
encoder 23 and JPEG graphic images are reproduced from the
BD-ROM 20 by a DCT-based decoder comprising an entropy
10.decoder 24, a dequantizer 25, and an inverse DCT unit 26.

In the case where a graphic image is encoded in
accordance with the JPEG format, the graphic image is managed
in a similar way that still images are recorded and managed.
The FDCT unit 21 transforms a graphic image from the spatial
15 domain to the frequency domain on an 8x8 block basis.

The quantizer 22 quantizes the data transformed to the
frequency...

...to
prevent information loss.

In a second embodiment of the invention shown in FIG. 13,
a predictive coding method is used, wherein high-resolution
25 graphic data is encoded with compression into JPEG images.

differ from application to application, the color depth can be adjusted depending on the target application. All or one of these conditions can be used in determining the color depth of a graphic image. When multiple graphic images are linked to a main picture image, the multiple graphic images may have different color depths.

The size of a graphic image cannot exceed the size of the main picture image and the maximum possible color depth for the graphic image is 24 bits.

One embodiment of a method of managing graphic data for a high-density optical disk according to the present invention employs a multiple color palette structure in which multiple color palettes are defined in the navigation area and used for graphic images. In the multiple color palette structure, palettes are defined for each color depth that is less than 24 bits
In the multiple color...

...palettes as shown in FIG. 6 can be used, wherein every pixel
7
value (e.g., R/G/B or Y/Cb/Cr) used in graphic images is defined in the palette information.

In the multiple color palette structure, fixed-size palettes with null code as shown in FIG. 7 can be used, wherein null code is assigned to every color value of the palettes that are not actually used in graphic images and thereby the size of palettes can be reduced.

In the multiple color palette structure, variable-size palettes as shown in FIG. 8 can be used, wherein only the 10 pixel values that are actually used in graphic images are defined in the palettes.

Palette search information such as a palette number, which points to a palette among the multiple palettes, is defined in each of graphic image information and thereby the palette information can be shared by multiple graphic images.

Fig. 9 illustrates a portion of the navigation information for graphic images recorded on a high density recording medium such as a BD-ROM. As shown in FIG. 9. for example, color palette information including multiple palettes and graphic image information about a plurality of individual graphic images are defined in the navigation information.

The graphic image information about a plurality of individual graphic images may include data size, palette number, and color depth for each graphic image. The palette number field may store one or more palette numbers so that the graphic image may be associated with more than one palette in the palette information.

As shown, the graphic image information may also include information about groups of graphic images instead of the information about a plurality of individual graphic images.

This information may include the same graphic information as

As shown in FIG. 4, a plurality of different graphic

5

images may be simultaneously overlaid on one main picture image and the plurality of graphic images may have different sizes and color depths.

An optical disk reproducing apparatus determines the degree of importance of each graphic image to be overlaid based on the contents thereof and displays the graphic image with a color depth proportional to the degree of importance.

For example, an image of the highest importance is displayed with 24-bit color...

...lowest

10 importance is displayed with 8-bit color depth.

In a flow diagram shown in FIG. 5, the optical disk reproducing apparatus generates a graphic image of a maximum color depth of 24 bits (S10) and adjusts the color depth for the graphic image depending on the degree of importance of the contents and size thereof (S11).

If 8-bit color depth is selected (S12), the optical disk reproducing apparatus generates an 8-bit color graphic image and palette information using corresponding navigation control information. Similarly, if 16-bit color depth is selected (S13), the optical disk reproducing apparatus generates a 16-bit color graphic image and palette information using corresponding navigation control information.

If 24-bit color depth is selected (S14), the color depth of the graphic image generated at step S10 remains unchanged.

The generated graphic image is displayed in various ways according to the display control information, as described above with reference to FIGS. 1 and 2.

In the case where only one color depth is used, the data size of a graphic image is large when a high color depth is used. On the other hand, the data size of a graphic image is small but the quality of the graphic image is deteriorated when a low color depth is used.

6

This drawback can be overcome by employing a variable color depth. In other words, the color depth of a graphic image is adjusted depending on the image size, bit rate, data amount, target application, or other conditions.

For example, the size of a graphic image is determined by the product of the numbers of horizontal and vertical pixels; therefore an image of size 720x480 pixels and an image of...

...on the color

sampling format (e.g., Y:Cb:Cr = 4:4:4, 4:2:2, 4:2:0) and the bit rate of a graphic image may vary depending on the video quality, the number of audio streams, etc. The color depth can also be adjusted variably depending on these conditions. In addition, because the contents of a graphic image

one or more graphic images. For example, each palette information segment may have an identifier, and the 25 reproduction information identifies a palette information segment using the identifier for...

...of the invention, and together with the description, serve to explain the principles of the present invention.

In the drawings.

FIG. 1 illustrates a graphical representation of main video overlaid with graphic images according to the DVD-Video standard;

FIG. 2 illustrates a structure of graphic data in the DVD-Video standard;

FIG. 3 illustrates a graphical representation of an embodiment of a method of managing graphic data for a high density recording medium in accordance with the invention;

FIG. 4 illustrates a graphical representation of the main data overlaid with a plurality of graphic images of different sizes and color depths;

FIG. 5 is a flow diagram illustrating an embodiment of a method of managing graphic data in accordance with the invention;

FIGS. 6-8 illustrate embodiments of palette information in accordance with the invention;

FIG. 9 illustrates an embodiment of the navigation information for graphic images recorded on a high density recording medium in accordance with the invention;

FIG. 10 illustrates exemplary pixel groups according to the invention;

4

FIG. 11 illustrates a schematic diagram of an encoding/decoding apparatus using the graphic coding format of the DVD-Video standard;

FIGS. 12 through 16 illustrate schematic diagrams of five first through fifth embodiments of encoding/decoding apparatuses of...

...that the invention may be fully understood, 15 exemplary embodiments thereof will now be described with reference to the accompanying drawings.

FIG. 3 is a graphical representation of an embodiment of a method of managing graphic data for a high-density recording medium such as an optical disk in accordance with the present invention. A main picture image has one or more corresponding graphic images, which have different sizes and color depths.

As shown, the main picture of size 1920x1080 pixels has three different associated graphic images, a graphic image of size 1920x1080 pixels, a graphic image of size 1280x1080 pixels, and a graphic image of size 640x1080 pixels.

The three graphic images have different color depths. The 1920x1080 graphic image has an 8-bit color depth, the 1280x1080 graphic image has an 8-bit or 16-bit color depth, and the 640x1080 graphic image has an 8-bit, 16-bit, or 24-bit color depth.

synchronization with a video/audio data stream is defined by the DVD-private format and designated as sub-pictures.

A sub-picture of the graphic data is of size 720x480, 20 pixels and has a palette with 2-bit color depth, which can support up to 16 colors. The graphic data is recorded on the DVD after being multiplexed with the video/audio stream.

A run-length coding method according to the DVD-Video standard is applied to the graphic data in which display 25 control information about sub-picture data is included. The display control information includes information on display timing, color change, blending ratio change, display position, size selection, etc.

Operations for providing various graphic effects to the graphic data, such as scroll-up/down, fade/wipe-in/out, and color change, can be performed selectively on a time basis.

Navigation information for the...

...information and language information.

An optical disk reproducing apparatus such as a DVD player displays the main video image and some or all of the graphic image of a sub-picture unit (SPU) as shown in Fig. 1 by blending the images using navigation information, wherein the graphic image of the sub-picture unit (SPU) is overlaid 15 on the main video image on a presentation time basis.

As shown in FIG. 2...

...being synchronized with the audio and video data. As alluded to above, the apparatus displays the main video image and some or all of the graphic image of a sub-picture unit 2 (SPU) by blending the images using the navigation information, wherein the graphic image of the sub-picture unit (SPU) is overlaid on the main video image in various ways on a presentation time basis.

The standardization for high-density read-only optical disks such as the Blu-ray disc ROM (BD-ROM) is still under way. A method for effective managing graphic data recorded on the high-density read-only optical disk such as a BD-ROM is not yet available.

10 3, DISCLOSURE OF INVENTION

The recording medium according to the present invention includes a data structure for managing reproduction of graphic data.

In one exemplary embodiment, a graphic information area 15 of the recording medium includes at least one graphic image information segment and at least one palette information segment. Each palette information segment provides color information, and each graphic image information segment provides reproduction information for reproducing one or more 20 graphic images.

In an exemplary embodiment, the reproduction information identifies a palette information segment to use in reproducing

English Abstract

The recording medium includes a graphic information area having at
least one graphic image information segment and at least one
palette information segment recorded therein. Each palette information
segment provides color information. Each graphic image information
segment provides reproduction information for reproducing one or more
graphic images.

Detailed Description

DESCRIPTION

RECORDING MEDIUM HAVING A DATA STRUCTURE FOR
MANAGING REPRODUCTION OF GRAPHIC DATA AND
RECORDING AND REPRODUCING METHODS AND APPARATUSES

5 1, TECHNICAL FIELD

The present invention relates to a method of managing
graphic data for a high-density recording medium such as an
optical disk (e.g., a Blu-ray Disc ROM (BD-ROM)).

2. BACKGROUND ART

Recording media such as optical disks capable of
recording large amounts of high-quality digital video/audio
data, for example, DVDs (digital...

...the market. The types of DVDs

include DVD-Video, DVD-VR (Video Recording), DVD-Audio, and
15 DVD-AR (Audio Recording).

In the DVD-Video, graphic data to be reproduced in

5, MODES FOR CARRYING OUT THE INVENTION

A high-density optical disk, for example, a Blu-Ray ROM (BD-ROM), 13D-RE, etc. in accordance with the invention may have a file or data structure for managing reproduction of video and audio data as shown...

...to reproduce this data structure. Based on the information contained therein, as well as user input received over the user interface (e.g., control buttons on the recording and reproducing apparatus or a remote associated with the apparatus), the controller 10 controls the drive 3 to reproduce the data...

...to demultiplex, and instructs the source depacketizer 4 on the source packet format. When multiple audio streams are recorded in a data area of the BD-ROM, the controller 10 checks the characteristic 5 audio packet ID (audio-PID) recorded in each audio packet.

Next, audio packets having audio packet IDs corresponding...

...a data structure for managing multiple audio streams recorded on a high-density recording medium (e.g., a high-density optical disk such as a BD-ROM).

As apparent from the above description, the present invention provides methods and apparatuses for recording a data structure on a high density recording medium for...

Claim

... and the packets of a same audio stream having a same packet identifier.

22 An apparatus for recording a data structure for managing reproduction of graphic data on a recording medium, comprising: a driver for driving an optical recording device to record 20 data on the recording medium; an encoder for...

each graphics stream in the associated segment.

22 A recording medium having a data structure for managing
30 reproduction of multiple graphics streams, comprising:
a data area having at least one graphics information packet
stored therein, the graphics information packet including
management information for managing reproduction of multiple
15

graphics streams recorded as packets along with the graphics
information packet.

23 A method of reproducing a data structure for managing
reproduction of multiple graphics streams from a recording medium,
5 comprising:
reproducing at least multiple graphics streams from a portion
of the recording medium in which the multiple graphics streams are
multiplexed, each graphics stream being a transport stream and
stored as one or more packets, each packet having a packet
identifier, and the packets of a same graphics stream having a same
packet identifier.

24 An apparatus for reproducing a data structure for
managing reproduction of multiple graphics streams from a
recording medium, comprising:
a driver for driving an optical reproducing device to
reproduce data recorded on the recording medium;
a controller for controlling the driver to reproduce at least
multiple graphics streams from a portion of the recording medium
in which the multiple graphics streams are multiplexed, each
graphics stream being a transport stream and stored as one or more
packets, each packet having a packet identifier, and the packets
of a same graphics stream having a same packet identifier.

25 A method of recording a data structure for managing
reproduction of multiple graphics streams on a recording medium,
25 comprising:
recording at least multiple graphics streams in a portion of
the recording medium such that the multiple graphics streams are
multiplexed, each graphics stream being a transport stream and
recorded as one or more packets, each packet having a packet
30 identifier, and the packets of a same graphics stream having a
same
packet identifier.

26 An apparatus for recording a data structure for managing
reproduction of graphic data on a recording medium, comprising:
16
a driver for driving an optical recording device to record
data on the recording medium;
an encoder for encoding at least multiple reproduction path
video data; and
a controller for controlling the driver to record at least
multiple graphics streams in a portion of the recording medium such
that the multiple graphics streams are multiplexed, each
graphics
stream being a transport stream and recorded as one or more packets,
each packet having a packet identifier, and the packets of a same
10 graphics stream having a same packet identifier.

17

10 streams as transport packets, and each transport packet in a same graphics stream having a same packet identifier; and a clip information file area of the recording medium having at least one clip information file stored therein, the clip information file including management information for reproducing the multiple graphics streams recorded on the recording medium, the management information identifying each of the multiple graphics streams based on the associated packet identifier.

12 The recording medium of claim 11, wherein in at least a portion of the data area, transport packets for the multiple graphics streams are multiplexed.

13 The recording medium of claim 11, wherein the management information identifies a coding format for each of the multiple graphics streams.

14 The recording medium of claim 11, wherein the management information includes display information for each of the multiple graphics streams.

15 The recording medium of claim 11, wherein the clip information file includes at least one program information field, the program information field including the management information for one or more program sequences, each program sequence associated with a different segment of at least a graphics presentation.

16 A recording medium having a data structure for managing reproduction of multiple graphics streams, comprising:

14 a management area having at least one program information field stored therein; each program information field including one or more program sequences, each program sequence associated with a different segment of at least a graphics presentation and including management information for managing reproduction of at least one graphics stream in the associated segment, and at least one program sequence including management information for multiple graphics streams in the associated segment.

17 The recording medium of claim 16, wherein the management information of each program sequence identifies each graphics stream in the associated segment.

18 The recording medium of claim 17, wherein a data area of the recording medium stores each graphics stream as transport packets, and each transport packet in a same graphics stream has a same packet identifier; and the management information identifies each graphics stream based on the associated packet identifier.

19 The recording medium of claim 17, wherein at least a portion of the data area stores a segment having multiple graphics streams associated therewith, and the transport packets for the associated multiple graphics streams are multiplexed in the portion of the data area.

20 The recording medium of claim 17, wherein the management information identifies a coding format for each graphics stream in the associated segment.

21 The recording medium of claim 17, wherein the management information provides display information for

streams recorded on the recording medium.

The above description further provides methods and apparatus for reproducing multiple graphics streams recorded on a high density recording medium based on a data structure, also recorded on the high density recording medium, for managing the reproduction of the multiple graphics streams.

While the invention has been disclosed with respect to a limited number of embodiments, those skilled in the art, having the benefit of this...

Claim

1 A recording medium having a data structure for managing reproduction of multiple graphics streams, comprising:
a data area storing at least multiple graphics streams in at least one portion thereof, the multiple graphics streams being multiplexed, each graphics stream being a transport stream and stored as one or more packets, each packet having a packet identifier, and the packets of a same graphics stream having a same packet identifier.

2 The recording medium of claim 1, wherein at least one of the multiple graphics streams is a subtitle stream.

3 The recording medium of claim 1, further comprising:
a management area including management information for managing reproduction of the multiple graphics streams.

4 The recording medium of claim 3, wherein the management information includes the packet identifier for each of the multiple graphics streams.

5 The recording medium of claim 4, wherein the management information includes coding format information for each of the multiple graphics streams.

6 The recording medium of claim 4, wherein the management information includes display information for each of the multiple graphics streams.

7 The recording medium of claim 3, wherein
a program information field includes the management information for managing reproduction of the multiple graphics streams.

8 The recording medium of claim 7, wherein
a clip information file includes the program information field.

9 The recording medium of claim 3, wherein
13

a clip information file stored in the management area includes the management information for managing reproduction of the multiple graphics streams.

10 The recording medium of claim 3, wherein a graphics stream information packet recorded with the packets of the multiple graphics streams includes the management information.

11 A recording medium having a data structure for managing reproduction of multiple graphics streams, comprising:
a data area of the recording medium storing multiple graphics

9

Fig. 7 illustrates a schematic diagram of an embodiment of an optical disk recording and reproducing apparatus according to the present invention. As shown, an AV encoder 9 receives and encodes data (e.g., movie video, audio, graphics, etc.). The AV Encoder 9 outputs the encoded data along with coding information and stream attribute information. A multiplexer 8 multiplexes the encoded data based...

...30 to reproduce this data structure. Based on the information contained therein, as well as user input received over the user interface (e.g., control buttons on the recording and reproducing apparatus or a remote associated with the apparatus), the

10

controller 10 controls the drive 3 to reproduce the data...

...perform,

instructs the demultiplexer 5 on the transport stream to 15 demultiplex, and instructs the source depacketizer 4 on the source packet format.

When multiple graphics streams are recorded in a data area of the BD-ROM, the controller 10 checks the characteristic packet

ID (graphics-PID) recorded in each graphics packet.

Next, graphics packets having packet IDs corresponding to a graphics stream selected by a user via the user interface (e.g., subtitle of a particular language) are routed to the AV decoder 6 by the demultiplexer 5 under the control of the controller 10.

The controller 10 also searches for and checks the 25 corresponding graphics coding information (graphicsCodingInfo) and graphic display information (graphicsDisplayInfo) in the program information field or graphics information packet and instructs the decoder 6 to perform decoding and display operations according to the coding format and display information designated 30 by the graphics coding and display information. For example with reference to Fig. 6, if the first graphics stream is a subtitle data for the English language and this subtitle stream is selected for display by the user, the optical disk recording and reproducing

11

apparatus reproduces source packets #2, #41 #7, etc., having transport packets with a graphics PID value of 'A', which corresponds to the selected graphics stream.

While Fig. 7 has been described as a recording and reproducing 5 apparatus, it will be understood that only a recording or only a...
...reproducing function.

As will be appreciated from the forgoing disclosure, the present invention provides a recording medium having a data 10 structure for managing multiple graphics streams recorded on a high-density recording medium (e.g., a high-density optical disk such as a BD-ROM).

As apparent from the above description, the present invention provides methods and apparatuses for recording a data structure 15 on a high density recording medium for managing multiple graphics

packet...

...indicates the value of the PID of the transport packets that shall contain the program map section applicable for the *i*th program sequence. The graphic-PID[*i*][stream-index] field indicates the PID value of each graphic stream in the *i*th program sequence. The graphicCodingInfo(*i*,stream-index) field indicates the coding format or method of coding each graphics stream in the *i*th program sequence. The graphicsDisplayInfo(*i*, stream-index) field indicates various display information for each graphics stream in the *i*th program sequence. For example, the display information may include display start and end information, display position information about the corresponding graphics data, size information, etc.

The graphics

PID field may be used in several different ways.

As discussed above, graphics stream may be a subtitle, menu, image, etc. Each graphics stream may be differentiated from another using, the graphics PID value. Namely, according to the present invention, the transport packets of a graphics stream have a same graphics PID, and different graphics streams have different graphics PIDs.

Fig. 6 illustrates a graphical representation of an A/V stream including multiple graphics streams structured and managed according to an embodiment of the present invention. As shown, transport packets for multiple graphics streams are divided into groups and the groups are multiplexed with groups of the other A/V stream transport packets (e.g., video and/or audio transport packets). Within a group of graphic stream packets, the packets for different graphics streams are multiplexed. As shown, each graphics stream includes transport packets having a same graphics-PID, and the different graphics streams have different graphics-PIDs. Specifically, Fig. 6 shows the source packets, but as discussed above, a source packet is comprised of a header and a transport packet.

Fig. 6 shows first - third graphic streams #1 - #3 in a group. The transport packets of the first graphics stream #1 each have a graphic PID value of 'A1', the transport packets of the second graphics stream #2 each have a graphic-PID value of 'B1', and the transport packets of the third graphics stream #3 each have a graphic-PID value of 'C1'.

Fig. 6 further shows that in one exemplary embodiment, a group of graphic stream packets begins with a graphics information packet. The graphics information packet may include the same graphics coding and display information supplied by the program information field regarding the graphics streams in the associated group of graphic stream packets.

embodiment of the present invention;
 Fig. 6 illustrates a graphical representation of an A/V stream including multiple graphics streams structured and managed according to an embodiment of the present invention; and
 FIG. 7 is a diagram illustrating the structure of an optical disc apparatus where the present invention is applied.

5, MODES FOR CARRYING OUT THE INVENTION

A high-density optical disk, for example, a Blu-Ray ROM (BD-ROM), DD-RE, etc. in accordance with the invention may have

25 a file or data structure for managing reproduction of video and audio data as...

...the same way a book is often organized into chapters.

Because of the large storage capacity of the newer, high-density recording media such as BD-ROM and BD-RE optical disks, different titles, various versions of a title or portions of a title may be recorded, and therefore...

...director's commentary, audio coding formats, etc.) provide different audio streams for reproduction. Optical disks of high density also provide the opportunity to have multiple graphic or sub-picture streams recorded thereon and reproduced therefrom.

Graphics streams include subtitles, menus, images, etc. For example, subtitles of different languages may be recorded as different graphic streams. Typically, a graphics stream is 30 reproduced along with associated video and/or audio data and, for example, overlaid on the associated video.

The data structure for managing reproduction of multiple graphics streams for a high-density optical disk in accordance

7 with embodiments of the present invention will be described along with methods and apparatuses according to embodiments of the present invention for recording and reproducing multiple graphics streams-

As discussed above, the CLIPINF directory includes a clip information file associated with each A/V stream file, and a clip information file includes...

...number-of program-sequences field.

As discussed above, a program sequence is associated with a segment 15 of, for example, a video, audio and/or graphics presentation.

For each program sequence i, the program information field provides at least the fields of: SPN
 program-sequence-start[i],
 program-map
 PID[i], graphics-PID[i][stream-index],
 graphicsCodingInfo(i, stream-index), and graphicsDisplayInfo(i,
 20 stream-index).

The SPN-Program-sequence-start[i] field indicates a source

Recently, standardization of high-density optical discs such as a read-only Blu-ray disc (BD-ROM), which has a higher recording capacity than a DVD, is underway. However, an appropriate method for managing multiple graphics streams for the high-density 20 optical disc has not been established.

3, DISCLOSURE OF INVENTION

The recording medium according to the present invention includes a data structure for managing reproduction of at least multiple graphics streams recorded on the recording medium.

In one exemplary embodiment, a data area of the recording medium stores at least multiple graphics streams in at least one portion thereof, the multiple graphics streams being multiplexed.

Each graphics stream is a transport stream and stored as one or more packets. Each packet has a packet identifier, and the packets 30 of a same graphics stream have a same packet identifier. In one exemplary embodiment, at least one of the multiple graphics streams is a subtitle stream.

2

According to another exemplary embodiment of the present invention, the recording medium includes a clip information file area having at least one clip information file stored therein. The clip information file includes management information for 5reproducing multiple graphics streams recorded on the recording medium. For example, the multiple graphics streams are recorded as transport packets, and each transport packet in a same graphics stream has a same packet identifier. The management information identifies each of the multiple graphics streams based on the 10 associated packet identifier. As further examples, the management information indicates the coding and display information for each graphics stream.

According to another exemplary embodiment of the present invention, the recording medium includes a management area having 15 at least one program information field...

...Each program

information field includes one or more program sequences. Each program sequence is associated with a different segment of at least a graphics presentation and includes management information for managing reproduction of at least one graphics stream in the 20 associated segment. At least one of the program sequences includes management information for multiple graphics streams in the associated segment.

In a further exemplary embodiment, a data area of the recording medium has at least one graphics information packet 25 stored therein. The graphics information packet includes management information for managing reproduction of multiple graphics streams recorded as packets along with the graphics information packet.

The present invention further provides apparatuses and 30 methods for recording and reproducing the data structure according to the present invention, and recording...

...the structure of a program

15 information field recorded on an optical disc according to an

English Abstract

The recording medium includes a data area storing at least multiple graphics streams in at least one portion thereof. The multiple graphics streams are multiplexed, and each graphics stream is a transport stream stored as one or more packets. Each packet has a packet identifier, and the packets of the same graphics stream have the same packet identifier.

DESCRIPTION

I

RECORDING MEDIUM HAVING DATA STRUCTURE FOR
MANAGING REPRODUCTION OF MULTIPLE GRAPHICS STREAMS
RECORDED THEREON AND RECORDING AND REPRODUCING
METHODS AND APPARATUSES

1, TECHNICAL FIELD

The present invention relates to a recording medium having
a data structure for managing reproduction of at least multiple
graphics streams recorded thereon as well as methods and
10 apparatuses for reproduction and recording.

2, BACKGROUND ART

An optical disc such as a DVD (Digital...

The standardization for high-density read-only optical disks
such as the Blu-ray ROM (BD-ROM) is still under way. An
effective
data structure for managing reproduction of video and audio data
15 recorded on the high-density read-only optical disk such as a
BD-ROM is not yet available.

a movie-mode program includes a button command,

the button command is a command for branching to the enhanced-mode program, and is recorded on the recording medium as a multiplexed stream after being multiplexed with the video data and subtitle data, and

each piece of the subtitle data is image data of a button, and the button command is executed when a confirmation operation is conducted with respect to the image data of the button.

22. The recording medium of Claim 1, wherein

the enhanced mode includes a virtual-machine mode for having a virtual machine execute one or more...

...pausing during the video data playback.

41. The playback device of Claim 35, comprising:

a demultiplexer operable to demultiplex a multiplex stream to obtain a button command, the video data, subtitle data;
an image decoder operable to decode image data of a button;
and

a video decoder operable to decode the video data, wherein

a movie-mode program includes the button command,

the button command is a command for branching to the enhanced-mode program, and is recorded on the recording medium as the multiplex stream after being multiplexed...

...the video data and the subtitle data,

each piece of the subtitle data is the image data, and
the movie-mode corresponding module executes the button command
when a confirmation operation is conducted with respect to the image data.

42. The playback device of Claim 23, wherein

the enhanced mode is...

...is described in a markup language.

43. The playback device of Claim 42, comprising:

a demultiplexer operable to demultiplex a multiplex stream to obtain a button command, the video data, subtitle data;
an image decoder operable to decode image data of a button; and
a video decoder operable to decode the video data, wherein

a movie-mode program includes the button command,

the button command is a command for branching to the enhanced-mode program, and is recorded on the recording medium as the multiplex stream after being multiplexed...

...the video data and the subtitle data,

each piece of the subtitle data is the image data, and
the movie-mode corresponding module executes the button command
when a confirmation operation is conducted with respect to the image data.

...F) Note that an example in FIG. 18 of the first embodiment is a mere example of a technique for describing playback controls of the BD-ROM according to the present invention. Other description techniques include directly branching from Navigation Button information in an AV stream to a Java object. FIG. 57 shows an example of a playback control for branching directly from Navigation Button information in an Av stream to a Java object. Describing Navigation Button information so as to perform such branching allows unrestricted descriptions of scene development, such as branching from a scene in which a character appears to...

...a menu (Chapter Menu) for displaying a list of Chapters and MOVIE objects for controlling the behavior of the menu may be recorded on a BD-ROM so that branching from the Top Menu is made possible. In addition, the menu may be called by pushing down a Chapter key on a remote controller.

(H) At recording on a BD-ROM, extension headers preferably are appended to TS packets structuring an AV stream. The extension headers, which are called TP(underscore)extra(underscore)header, include an...

...format.

(M) Although Cell information in the above embodiments specifies a start and end of a playback section using time information, logical addresses on a BD-ROM can be used instead. In addition, CELL in the above embodiments may be called "PlayItem".

(N) TMAP in stream management information may be called "EP...

...stream management information, and PL information may be stored in advance, as with cache memory. Herewith, the time lag until reading this data from the BD-ROM can be shortened. In addition, although BACKUP memory 14 saves the stored values of registers in stack form, when consideration is given to the relationship...

...based (U.S. No. 60/409,999 and No. 60/440,623). In addition, playback control engines 12 in the above embodiments correspond to a BD-ROM-FF processor 3025 and a scenario processor 304 (FIG. 35) disclosed in the specification of the basic application. The module manager 20 corresponds to a...

...CLAIMS or pausing has been instructed during playback of the video data.

19. The recording medium of Claim 13, wherein a movie-mode program includes a button command,

the button command is a command for branching to the enhanced-mode program, and is recorded on the recording medium as a multiplexed stream after being multiplexed with the video data and subtitle data, and

each piece of the subtitle data is image data of a button, and the button command is executed when a confirmation operation is conducted with respect to the image data of the button.

20. The recording medium of Claim 1, wherein

the enhanced mode is a mode for having a browser execute a program, and

an enhanced-mode program is described in a markup language.

21. The recording medium of Claim 20, wherein

The present embodiment relates to BD-ROM production processes. FIG. 56 is a flowchart showing BD-ROM production processes according to an eighth embodiment.

The BD-ROM production processes include a material producing process S101 for creating materials such as video records and audio records, an authoring process S102 for generating an application format with the use of an authoring device, and a pressing process S103 for creating a master BD-ROM and pressing and laminating to complete BD-ROMs.

Of these processes, the authoring process targeting the BD-ROM comprises five processes: a scenario editing process S201; a material encoding process S202; a multiplexing process S203; a formatting process S204; and an emulation process...

...is for converting an outline created in the planning stage into a format comprehensible to a playback device. The scenario editing results are created as BD-ROM scenarios. In addition, multiplexing parameters for realizing multiplexing are also created in the scenario editing.

The material encoding process S202 is an operation for respectively... material encoding, and the result is converted into a single digital stream.

In the formatting process S204, various types of information are created based on BD-ROM-oriented scenarios, and the scenarios and digital stream are adapted to a BD-ROM format.

The emulation process S205 is for confirming whether or not the authoring result is correct.

Since Java objects and WebPage objects can be respectively...the event of branching from a PL to another PL, the module manager 20 retrieves a filename not from the Index Table recorded on a BD-ROM but from the Index Table recorded on the HD, instead. Then, the module manager 20 reads video data having the retrieved filename, and has the...

...present embodiment described above enables a playback device to download an Index Table and replacement videos in the case when certain PLs recorded on a BD-ROM have moral and ethical issues. As a result, it is possible to have a user watch replacement videos, instead of the problematic videos, by causing...

...make indirect referencing via the new Index Table during the playback. Since there is no need to rewrite all the dynamic scenarios recorded on a BD-ROM when partial replacement is desired, the present embodiment is capable of avoiding the risk of recalling the recording medium even when such problems are raised...

...are representative modifications of the present invention.

(A) In all the embodiments above, an optical disk according to the present invention is implemented as a BD-ROM. However, the optical disk of the present invention is characterized by the recorded dynamic scenarios and Index Table, and these characteristics are not dependent on the physical properties of a BD-ROM. Any form of recording media is applicable as long as there exists the capacity to record dynamic scenarios and Index Tables. For example, optical disks...

...in parallel and played as a single video edit.

(B) Although the playback devices in all the embodiments first decode AV streams recorded on a BD-ROM and then output the result to a TV, the playback device may be structured only from a BD-ROM drive, and all of the other elements are equipped on a TV. In this case, the playback device and the TV can be incorporated into...

5. Fifth Embodiment

In the first embodiment, application programs in the Java mode describe playback controls targeted for a BD-ROM using programming functions and system variables supplied from the playback control engine. That is, programming functions and system variables supplied from the playback control engine...

...directly used for describing playback controls. On the other hand, applications in the Java mode according to a fifth embodiment describe controls targeted for a BD-ROM via member functions supplied by the Java module 17.

Explanation of the kind of member functions playback controls being described is in reference to FIG. 49. FIG. 49 shows member functions of classes belonging to the Java mode. The Java mode, which is Layer 4, has a BD-ROM only package containing classes of BD-ROMStatus, BD-ROMReproduction, and BD-ROMEvent.

The following gives an account of individual classes in the package. The BD...

...PL playback using a member function of the BD-ROMReproduction class.

According to the present embodiment as described above, since playback controls targeted for a BD-ROM is described via a package in the Java module 17, it is possible to describe the playback controls targeted for a BD-ROM in the same style as general Java language programming style. This allows to enhance production efficiency of software houses that have entered producing movie works.

Note that it is desirable that the package of the present embodiment is issued by an organization in charge of license management of the BD-ROM standardization under the condition that the organization enters into an official contract with software houses developing application programs. The contract includes a prohibition provision of...

...In the first to fifth embodiments, MOVIE objects perform transitions from the MOVIE mode to the Java mode based on branch commands in the Navigation Button information. Here in a sixth embodiment, transitions from the MOVIE mode to the Java mode are performed via a menu. FIG. 51 shows a menu...

...Top Menu is made possible. The Extra Menu, which receives a selection between the Java mode and the Browser mode from a user, includes a button for receiving a transition to the Java mode and a button for receiving a transition to the Browser mode. FIG. 52 shows MOVIE objects and an Index Table according to the sixth embodiment. The figure differs...

...The reason of setting the filtering information is described below. The AV stream includes, in addition to video and audio streams, streams such as Navigation Button information and subtitle streams. The Navigation Button information is necessary for the MOVIE mode, but it is not always the case with the Java and Browser modes. This is because, in the Java mode, CGs can be rendered using the Java language, and there is no need to employ the Navigation Button information. In order to treat the Navigation Button information as invalid in the Java mode, such filtering information is required. However, if the filtering information is set in PL information and the above...

...for sharing of an actual AV stream by setting APP.Flag and filtering information in PL information.

8. Eighth Embodiment

menus of the TopMenu, can be selected from the TopMenu. The arrow sw1, sw2, and sw3 in the figure schematically show menu switching by button selection. The TopMenu is a menu having buttons arranged thereon for receiving either an audio selection, a subtitle selection, or a Title selection to perform (buttons sn1, sn2, and sn3 in the figure).

The TitleMenu is a menu having buttons arranged thereon for receiving a selection from movie works (Titles), such as a cinema version, a director's cut version, and a game version. The AudioMenu is a menu having buttons thereon for receiving whether audio playback is to be in Japanese or English, and the SubtitleMenu is a menu having buttons thereon for receiving whether subtitle display is to be in Japanese or English.

FIG. 47 shows MOVIE objects for operating menus having such a hierarchy.

A FirstPlay object (FirstPlay OBJ) is a dynamic scenario describing a startup procedure taken when a BD-ROM is loaded in a playback device. The square boxes depicting the FirstPlay object represent commands for executing the setup procedure. The last command of the...

...square boxes depicting the TopMenu object are schematic representations of individual commands showing the control procedure. These commands include commands for changing a state of buttons in the TopMenu in response to operations from a user, and branch commands for branching in response to confirmation operations made for buttons. The branch commands realize menu switching from the TopMenu to the TitleMenu, from the TopMenu to the SubTitleMenu, and from the TopMenu to the AudioMenu...

...square boxes structuring the AudioMenu object are schematic representations of individual commands showing the control procedure. These commands include commands for changing a state of buttons in the AudioMenu in response to operations from a user, and commands for updating SPRMs used in audio settings in response to confirmation operations made for buttons.

A SubTitleMenu object (SubTitleMenu OBJ) is a dynamic scenario for controlling the behavior of the SubTitleMenu. The square boxes structuring the SubTitleMenu object are schematic representations of individual commands showing the control procedure. These commands include commands for changing a state of buttons in the SubTitleMenu in response to operations from a user, and commands for updating SPRMs used in subtitle setting in response to confirmation operations made for buttons.

A TitleMenu object (TitleMenu OBJ) is a dynamic scenario for controlling the behavior of the TitleMenu. The square boxes structuring the TitleMenu object are schematic representations of individual commands showing the control procedure. These commands include commands for changing a state of buttons in the TitleMenu in response to operations from a user, and branch commands for branching in response to confirmation operations made for buttons. The branch commands realize branching to individual Titles.

These MOVIE objects relating to the menus allow to realize menu behavior such as that realized in...

...described in the first embodiment, these indexes are referred to by dynamic scenarios of any of three modes.

The FirstPlay Index is referred to during BD-ROM startup. The filename of the FirstPlay object is described in this Index.

The TopMenu Index, AudioMenu Index, SubtitleMenu Index, and TitleMenu Index are referred to...

...subtitle switching similar to normal DVDs.

...lblack.png,10,200)); and rendering "2white.png" at the coordinates (330, 200), (Draw(2white.png.330,200)). "lblack.png" is image data of a button in selected state. "2white.png" is image data of a button in normal state. The graphic image ig1 in FIG. 36 is a graphic image rendered by the event handler in the figure. The buttons bn1 and bn2 in the figure are obtained by decoding "lblack.png" and "2white.png", respectively. GPRM(0) indicates which button of these two is in selected state. GPRM(0) being set to "1" means that, of the buttons bn1 and bn2, the button bn1 is set in selected state.

The handler hd2 is a handler for executing function(PlayPL: (-,-,0)) when TimeEvent t2 occurs. TimeEvent t2 is an event that occurs immediately before the...

...image ig2 in FIG. 37 is an image rendered when the condition is true. When the condition of the IF statement is true, the right button bn2 is set in selected state as the image jg2. The graphic image ig1 of FIG. 36 is shown next to the image jp2. The comparison of these images reveals that the event handler switches buttons in selected state according to the UserEvent occurrence.

The ELSE clause in the IF statement involves judging whether or not the condition of SPRM(8) being OK is...

...and images rendered by the event handlers of FIGs. 36 and 37. Since the event handler driven by TimeEvent t1 is a handler for combining buttons with pictures, the image ig1 (including the buttons bn1 and bn2) is combined with respect to the first picture pc1, the middle picture pc2, and the last picture pc3 in the PL, and...

...the PL is played, the first picture data is displayed, as indicated by the arrow py1, after the last picture data is displayed, and the buttons are combined with the first picture data. Unless there is a user operation, display of such combined images is repeated. If a UserEvent occurs as...

...describe a playback procedure in which a single Cell is repeatedly played until a user operation is conducted, and branching is performed according to a button as a result of a user operation.

With the use of such event handlers, controls similar to menu behavior realized in DVDs can be readily...

...to writing in. With a further development of the event handlers, it is possible to realize elaborated menu display where CGs operate in place of buttons, for example. Accordingly, the range of expressions involved with movie productions will be expanded.

Thus concludes the description of the improvement in Java objects according...the screen display with transverse lines in FIG. 44 exaggeratingly depicts the fast-forward PL playback in progress, likened to VTR playback. In an actual BD-ROM fast-forward, such transverse lines do not appear on screen. Here, it is preferable to clear CGs from the screen when the fast-forward is...

...possible to make motion of CGs rendered by Java objects more realistic.

4. Fourth Embodiment

A fourth embodiment relates to improvements in realizing, on a BD-ROM, menu controls similar to those of a DVD. FIG. 46 shows a menu hierarchy realized by a BD-ROM. The menu hierarchy in the figure has a structure where TopMenu is at the highest level, and TitleMenu, SubTitleMenu, and AudioMenu, all of which are subordinate

the BD-ROM on a first-in first-out basis.

The demultiplexer 3 retrieves ACCESS UNITs from the track buffer 2 and demultiplexes these to obtain video and...

...4 while the audio frames are outputted to the audio decoder 6. A subtitle stream is stored in the image memory 7, and the Navigation Button information is stored in the dynamic scenario memory 15. Demultiplexion performed by the demultiplexer 3 includes conversion processing for converting TS packets into PES packets...

...outputs uncompressed-format audio data.

The image memory 7 is a buffer for storing subtitle streams read from BD-ROMs, PNG data in the Navigation Button information, ...and current stream management information. A current PL is a PL currently targeted for processing from among plural pieces of PL information recorded on the BD-ROM. Current stream management information is a piece of the stream management information currently targeted for processing from among plural pieces of the stream management information recorded on the BD-ROM.

The playback control engine 12 executes various functions, such as (1) AV playback function, (2) PlayList playback functions, and (3) status-acquisition/setting functions in...

...Chapter, a number of the currently-being-played PL (PlayList Number), a number of the currently-being-played CELL (PlayItem Number), a number of the button in a selected state (Selected Button), and time information showing the current playback point.

The dynamic scenario memory 15 is a memory storing the current dynamic scenario, and is used for...

...and BROWSER module 18. The current dynamic scenario is the dynamic scenario currently targeted for processing from among the plurality of scenarios recorded on the BD-ROM.

The DVD-like module 16, which is a DVD virtual player that is the main execution body of the MOVIE mode, executes current MOVIE objects...

...and outputs information indicating detected user operations (hereinafter, "UO") to the module manager 20.

The module manager 20 holds an Index Table read from the BD-ROM and performs mode management and branch controls. The mode management performed by the module manager 20 refers to the allocation of modules; namely which of...

...CELLy, and a decoding procedure. This procedure involves: identifying ACCESS UNITv including the In-point video frame of CELLy from TMAP (Step S48); instructing the BD-ROM drive 1 to read ACCESS UNITv (Step S49); instructing the video decoder 4 to decode the video frames included in ACCESS UNITv (Step S52) after...

...table. As a result of the change in branch targets, it is possible to close a path for branching to enhanced-mode programs when the BD-ROM is loaded on core system playback devices not having a Java Virtual Machine and a browser, and thus operation assurance of the recording medium according...

...Java object that executes PL playback and performs various playback controls in synchronization with the PL playback.

FIG. 32 shows a file structure of a BD-ROM according to the second embodiment. What is new in the figure is that YYY.Mark (PLMark) and XXX.Mark (ClipMark) have been added.

PLMarks are...

integrated management.

FIG. 23A shows an internal structure of INFO.BD-ROM. As shown in the figure, INFO.BD-ROM includes an Index Table. The Index Table is an indirect reference table that is referenced when branching from one dynamic scenario to another dynamic scenario...

...does not have an Index in the Index Table.

TITLE#1-#m INDEXES are Indexes for the 1st) to m)th) Titles entered in the BD-ROM. In these Indexes are described the filenames of MOVIE objects that are to be branch destinations when the 1st) to mth) Title numbers are selected...

...a filebody (ZZZ) and an extension (.MOVIE).

The TITLE#m+1-#n INDEXES are Indexes for the m+1th) to nth) Titles entered in the BD-ROM. In these Indexes are described the filenames of WebPage objects/Java objects that are to be branch destinations when the m+1th) to nth) Titles...

...an Index for storing the filename of a MOVIE mode scenario that is executed, instead of an enhanced mode scenario, in the case when the BD-ROM is loaded in a playback device inoperable to execute the enhanced mode, and branching to the enhanced mode is instructed by the playback device.

Here...

...playback device in which program execution using a Java virtual machine and a browser is possible is called a full system. Indirect referencing of a BD-ROM by a core system and a full system is described below with reference to FIGs. 24A-24B. Here, the description of indirect referencing assumes a BD-ROM on which a plurality of dynamic scenarios is recorded (001.MOVIE, 002.MOVIE, 003.MOVIE, ..., 001.CLASS, 002.CLASS, 003.CLASS, ...), as shown in FIG. 24A. FIG. 24B shows an exemplified description of an Index Table when the plurality of dynamic scenarios shown in FIG. 24A is described in the BD-ROM. In the exemplified description shown in FIG. 24B, the filenames of the MOVIE mode scenarios (001.MOVIE, 002.MOVIE, 003.MOVIE, ...) are described in Title...

...find which file to read as the Java object by referring to this Index.

FIG. 27 shows what kind of branching is performed when a BD-ROM having the scenarios, shown in FIG. 18, recorded thereon is loaded in a core system playback device. Depicting the arrows in FIG. 18 using the...

...object which is executed when branching to MOVIE object 0 is performed. Because a user can implement a game in the MOVIE mode when the BD-ROM is loaded in a core-system playback device, it is possible to avoid causing the user disappointment about Java/Browser modes not being implemented.

Thus...

...FIG. 28 shows an internal structure of the playback device according to the present invention. As shown in the figure, the playback device comprises: a BD-ROM drive 1; a track buffer 2; a demultiplexer 3; a video decoder 4; a picture plane 5; an audio decoder 6; an image memory 7...

...a BROWSER module 18; a UO controller 19; a module manager 20; a dispatcher 21; a rendering engine 22 and a communication unit 23.

The BD-ROM drive 1 performs loading/ejecting of a BD-ROM, and accesses the loaded BD-ROM.

The track buffer 2 is a FIFO memory that stores ACCESS UNITS read from

are uniquely identified with the identification number "ZZZ". Expressing the identification number of the scenarios as "ZZZ" shows...

...CG rendering and website accesses, can be preferably described in the Java language and HTML, respectively. Any other processing, i.e. playback controls of the BD-ROM, can be described using programming functions supplied from Layer 3 (static scenarios).

The following description relates to functions supplied from Layer 3 (static scenarios).

(a...

...of CELL currently targeted for playback

SPRM(8) : time information showing current playback point

SPRM(9) : count value of navigation timer

SPRM(10) : number of button currently in selected state

SPRM(11)-(12) : Reserved

SPRM(13) : setting of parental level by user

SPRM(14) : setting related to image playback of playback device

SPRM(15) : setting...

...Reserved

(SPRM(1) and SPRM(2))

SPRM (1) and SPRM(2) are set by a PRE command prior to PL playback, and updated by a Button Command in Navigation Button information during playback of the AV stream. The following application is made possible by referring to SPRM(1) and SPRM(2) . Here, for example, PL...

...will improve the efficiency of language learning.

(SPRM(3))

SPRM(3) is set by a PRE command prior to PL playback, and updated by a Button Command in the Navigation Button information during playback of the AV stream. In the case where multiangle sections are included in the AV stream, it can be found that video...

...found by referring to SPRMs(4)-(7). It should be noted that SPRMs(4)-(7) are not directly updated by PRE commands, POST commands, and Button commands, but they are updated by commands for PL playback. Although thus performed indirectly, the updates are implemented with dynamic scenarios, and therefore it can...

...10) is updated to a value indicating a display start time (Presentation Time) of the new piece of picture data.. In the case where a Button Command in Navigation Button information has been described so that a transition from the MOVIE mode to the Java mode is performed during PL playback, a Java object in the Java mode is able to find a point to which a user has finished watching the movie work on the BD-ROM where the Button Command is stored. Additionally, in the Java mode, game software can be described so that appearing characters will be changed depending on the watching point...

...makes games in the Java mode more exciting. It should be noted that SPRM(10) is not directly updated by PRE commands, POST commands, and Button commands, but it is updated by commands for PL playback. Although thus performed indirectly, the updates are implemented with dynamic scenarios, and therefore it can...

...Integrated Management

The following gives an account of information for integrating and managing dynamic scenarios in the MOVIE mode, Java mode, and Browser mode. INFO.BD-ROM shown in FIG. 3 is such information for

"M-OBJ" below.

FIG. 16 shows an example of the MOVIE object in the case where the Navigation Button information in the AV stream is set as shown in FIG. 15. The MOVIE object in the figure is composed of: a PRE command for ...

...to MOVIE object #m+1 is performed if GPRM(0) shows "0", which is a value at the initialization. On the other hand, if a button selection is performed when a menu is displayed and GPRM(0) is set to a value other than "0", then branching is performed to another Title (Title#m).

If commands for changing the register setting value according to user operations are incorporated in the Navigation Button information, and conditional branching using the register setting value in a playback device is described as the POST commands, it is possible to easily create ...

...movie work whose progress of playback can be changed according to user operations.

Since there are two types of scenarios in the MOVIE mode (Navigation Button information and MOVIE objects), processing needing to synchronize precisely with the button behavior on a menu can be described in Navigation Button information, and integrative processing such as pre- and post-processing for PL playback can be described in MOVIE objects. Thus, the command description can be changed depending on whether processing to be synchronized with buttons or integrative processing, which increases the range of expression for playback controls. Furthermore, the description of playback controls does not require playback devices to have large capacity memory by writing new Navigation Button information over old one, even if the number of playback controls needing to synchronize with buttons increases.

1.4 Dynamic Scenarios in Java Mode

The following explains dynamic scenarios used in the Java mode. ZZZ.CLASS is a class file in...

...figure is identical to the exemplified description of the MOVIE object shown in FIG. 16. GPRM(0) in the figure is set by the Navigation Button information incorporated in the AV stream. GPRM(0) is a parameter managed on Layer 3 (static scenarios) in the layer model. Since GPRM(0) can...

...be switched according to GPRM(0) that has been set in the MOVIE mode. The value in GPRM(0) can be changed by the Navigation Button information in the MOVIE mode, and a CG to be rendered can be switched in the Java mode. With cooperation between a MOVIE object and...

...scenes from a movie can be programmed in the Java language, it is possible to have a number of software houses set their entry into BD-ROM producing businesses.

1.5 Dynamic Scenarios in Browser Mode

A WebPage object (ZZZ.HTM) is a scenario described in a page-description language, such as...

...access is made to a website pertaining to Character C when GPRM(0) is "3". GPRM(0) in FIG. 22 is set by the Navigation Button information incorporated in the AV stream. In addition, since GPRM(0) is in Layer 3 (static scenarios) in the layer model, and can be referred...

...ZZZ.MOVIE, ZZZ.CLASS, and ZZZ.HTM, is an abstract representation of a 3-digit identification number appended to the individual dynamic scenarios in the BD-ROM. That is, the scenarios in FIG. 23

indicated by the pushed arrow key by referring to the Relationship with upper/lower/side buttons in Button Affiliated information, and then change a state of the button. Thus, according to the push down of an arrow key, the state of a button in the direction indicated by the key is changed. Subsequently, when the confirmation operation is performed by a user, it is possible to execute a dynamic playback control according to the pushed button by implementing Button Command of the Button Affiliated information corresponding to the button.

Since the Navigation Button information is incorporated in the AV stream, it is convenient in the description of playback controls for having a playback device execute specific processing according...

...which a particular frame of videos appears on a screen, that is, playback controls synchronized precisely with the video contents. In addition, since the Navigation Button information is multiplexed on the actual AV stream, even when there are hundreds of sections needing to perform playback controls, there is no need to store all the Navigation Button information corresponding to the sections in memory. The Navigation Button information is read from the BD-ROM for every ACCESS UNIT along with video packets. Therefore, it is preferable to have pieces of the Navigation Button information corresponding to a video section for the current playback reside in memory, and then to delete these pieces of the Navigation Button information from memory when playback of this video section is over and store pieces of the Navigation Button information corresponding to the next video section in memory. Since the Navigation Button information is multiplexed on the AV stream, the installed memory can be kept to a minimum required amount even when, for instance, there are hundreds of pieces of the Navigation Button information.

An exemplified description of Button information is explained with reference to FIG. 15. FIG. 15 shows an example of when button controls are implemented using the Navigation Button information multiplexed on the AV stream.

The AV stream in FIG. 15 is a movie, and multiple buttons in the figure are displayed, being combined with one frame of the movie. Buttons A, B, and C in the figure each correspond to characters appearing in the movie works, and the state of each button is switched between selected and confirmed states through a selection operation for selecting one of Characters A, B, and C appearing in the movie.

In FIG. 15, the Navigation Button information is placed, in the video stream, ahead of a period where an interactive operation is required. When a button on a menu is confirmed, the Navigation Button information multiplexed on the AV stream in the figure sets GPRM(0) to a value unique to the button. GPRM(0) is a register setting value managed on Layer 3 (static scenarios) in the layer model. Specifically speaking, GPRM(0) is set to "1" when the button for Character A is confirmed, and GPRM(0) is set to "2" when the button for Character B is confirmed. When the button for Character C is confirmed, GPRM(0) is set to "3". Rendering the Navigation Button information in this way allows for saving, in GPRM(0), information on which button was selected at the time of the menu rendered. Thus completes the description of the Navigation Button information.

A MOVIE object (XXX.MOVIE) is a dynamic scenario described in commands that resemble those comprehensible to DVD playback devices. The MOVIE object is...

...with PLs whose playback is instructed with individual MOVIE objects is called Titles. Titles are units that correspond to an entire movie work on the BD-ROM. "MOVIE object" is sometimes shortened to

...programs in character. Here, dynamic playback controls have two modes. One of the two modes is a mode for playing video data recorded on the BD-ROM (normal mode) in a playback environment specific to AV devices, and the other mode is for enhancing the added value of video data recorded on the BD-ROM (enhanced mode). FIG. 12 shows playback modes on Layer 4 of the layer model. One normal mode and two enhanced modes are shown on Layer...

...description of control procedures in the Java language comprehensible to Java Virtual Machines. In the case where playback controls are for controlling motion of computer graphics (CG), it is possible to define a playback control, in the Java mode, for a CG image moving around (an owl in the figure) next...

...Dynamic Scenarios in MOVIE Mode

The following description relates to dynamic scenarios in the MOVIE mode. Dynamic scenarios in the MOVIE mode include the Navigation Button information in transport streams and MOVIE objects.

The Navigation Button information, which is one of streams multiplexed on the AV stream, controls the behavior of buttons on a menu, and executes playback controls in response to a confirmed button. The menu behavior includes (i) changing a button status on the menu in response to a push down of an arrow key on the remote control, (ii) updating a register value in a playback device according to a button confirmation on the menu, and (iii) realizing branching in response to a button confirmation on the menu. Controlling the behavior and having a playback device execute commands according to buttons are roles of the Navigation Button information. FIG. 14 shows a structure of the Navigation Button information. The Navigation Button information is composed of Button control information and Image Data. Image data comprises, as indicated by the dashed line hh1, plural pieces of PNG data (PNGs) and a look up...

...Individual pieces of the PNG data (PNG data #1, PNG data #2, and PNG data #3) in Image Data are image data for rendering each button (Button #1, Button #2, and Button #3) on the menu.

The Button control information comprises, as indicated by the dashed line hh2, Page Affiliation information and Button Affiliated information. The Page Affiliation information is, as indicated by the dashed line hh3, structured from "Button display begin Time", which indicates a beginning time for displaying buttons, "Button display end Time", which indicates an ending time for the display, and "Initially selected Button", which indicates a button to be in selected state at the initial condition.

The Button Affiliated information is, as indicated by the dashed line hh4, structured from plural pieces of Button Affiliation #1, Button Affiliation #2, ... and so on. Each piece of the Button Affiliations is, as indicated by the dashed line hh5, composed of "Button image information" that indicates, from among plural pieces of the PNG data, which is an image for a corresponding button, "Button display location" that indicates a location of the button image, "Relationship with upper/lower/side buttons" that indicates which buttons are located on the left, right, above and below of the button, respectively, and "Button Command" to be executed when the button is confirmed.

In the Button Affiliated information related to individual buttons on a menu, which buttons are located on the left, right, above and below of each button is described. Therefore, it is possible to, in response to a push down of an arrow key on the remote control by a user, identify a button located along the direction

...Stream) format digital stream, and is obtained by multiplexing a video stream, one or more audio streams, one or more subtitle streams, and the Navigation Button information. The video stream means a video portion of a movie, the audio streams mean audio portions of the movie, the subtitle streams means subtitles of the movie, and the Navigation Button information means procedures of dynamic playback controls that target menus. FIG. 6 schematically shows how the AV stream is configured.

The AV stream (Level 4...

...Level 1) respectively into PES packet sequences (Level 2), each of which is then converted to TS packets (Level 3), (ii) likewise converting the Navigation Button information (Level 7) to a PES packet sequence (Level 6), which is then converted into TS packets (Level 5), (iii) and then multiplexing all the...

...the TS packets storing audio frames so that the audio frames are positioned close to the video frames that are to be read from the BD-ROM at the same time as the audio frames. Since the Navigation Button information relates to dynamic playback controls, the explanation is omitted here. In addition, subtitle streams have less to do with the present embodiment, and therefore...

...from FIG. 6.

The AV stream generated through the above process is portioned into a plurality of extents and recorded in an area of the BD-ROM, as is the case with general computer files. FIG. 7 schematically shows how the AV stream is recorded on the BD-ROM.

A length of each extent constituting the AV stream and an address indicating where, in the BD-ROM, the extent is recorded are described in file management information fkl.

It can be seen that, for each of three extents (Extent 1, Extent 2...

...Note that the filename "XXX" in XXX.M2TS is an abstract representation of the 3-digit identification number appended to the AV stream in the BD-ROM. That is, the AV stream in FIG. 7 is uniquely identified with the "XXX". Thus completes the description of the stream (XXX.M2TS). It should...

...jy4) involves indirect referencing in which the addresses of ACCESS UNITS included in the AV stream are specified via the TMAP.

Playback sections on the BD-ROM that are formed from groupings of Cell information, stream management information, and the AV stream are called "CELLs". Logical playback units on the BD-ROM that are formed from groupings of PL information, stream management information, and the AV stream are called "PlayLists" (abbreviated as "PL"). Movie works recorded on the BD-ROM are structured in these logical playback units (PLs). Therefore, it is possible to easily create, as distinct from the actual movie, movie works made of...

...variations of movie works increase simply by defining various pieces of PL information.

There are, in addition to PLs and CELLs, playback units in the BD-ROM called Chapters. Chapters are structured from one, two, or more CELLs.

Also, the filename "YYY" of the PL information is an abstract representation of the 3-digit identification number appended to PL information in the BD-ROM. That is, the PL information in FIG. 11 is uniquely identified using the identification number, "YYY". Expressing the identification number of the PL information as...

...ABSTRACT A1

Recorded on the recording medium (BD-ROM) is an AV stream
that is obtained by multiplexing a video stream and one or more audio
streams. MOVIE objects are scenarios showing playback procedures...

...SPECIFICATION A1

Technical Field

The present invention relates to a video-data recording medium such as
Blu-Ray Disc Read Only Memory (hereinafter simply "BD-ROM"),
a playback device for playing such a recording medium, a program, a
playback method, and a recording method, and in particular relates to a
technology...

...In the case of seeking integration with a DVD playback environment, in
the recording medium of Claim 13, a movie-mode program may include a
button command; the button command may be a command for
branching to the enhanced-mode program, and may be recorded on the
